News updates, features, forums: www.computerworld.com
December 16, 1996 • Vol. 30 • No. 51 • 184 pages • \$3/Copy \$48/year

 The secret is out.

You're in IS as much for the tech-toys as for the joy of tape backup. With that in mind, *Computerworld* checked out some cool products that might fill out this year's Christmas list or fit into your plans for 1997. Digital cameras and new links to the Internet will appeal to your corporate side. But Nintendo 64, virtual-reality headsets and other games will appeal to the kid in you.

Bower's *Selfies*, page D4

Tom Obrey, chief marketing officer at PixelMedia, says an integrated environment could save on brand training costs.

Unification, developer-style

- Microsoft to integrate app dev environments

By Sharon Gaudin

MICROSOFT CORP. is readying a single environment that will let programmers use multiple languages and tools to build applications. Computerworld has learned

Developers and analysts said the new environment — known by the code name Boston — could save a huge amount of application development time. It also could reduce the level of language training developers must undergo and increase component reuse in corporate applications.

Today, developers often use three or more languages and tools, each with its own environ-

ment, to build a single complex application. That means a developer must know several languages or work within a team.

Microsoft is expected to unveil the environment at its Developer Days conference March 19, according to several sources close to the company. Microsoft declined to comment further.

But developers had plenty to say.

"It would be awesome. It would stop us from shopping around," said Tom Obrey, chief operating officer and co-founder of PixelMedia, Inc., an interactive media design and production company in Portsmouth.

High-end PC hype

► *Users slow to adopt 200-MHz Pentiums*

By Laura DiDuo, Patrick Dryden and April Jacobs

VENDORS MAY BE PUSHING the latest high-end PCs and client/server applications, but users aren't rushing out to buy 300-MHz machines or install 32-bit applications just yet.

Barry O'Neil, general manager at CompUSA, Inc. in Woburn, Mass., said systems with 133- and 166-MHz chips are the company's biggest sellers.

O'Neil's observation jibes with responses from most of the dozen users interviewed last week by *Computerworld*. They said they are migrating mostly to 133- and 166-MHz chips in the short term.

High-end PC type, page 135

PC shoppers are holding off on migrating to 200-MHz Pentiums, citing not enough performance boost

Sybase users losing confidence in turnaround

By Craig Stedman

USERS WHO HOPE to see a re-vamped and recharged Sybase, Inc. are waiting. And waiting. But an increasing number have

given up and switched to Sybase's database rivals, according to a tracking survey by the Computerworld Information Management Group.

The survey reveals that Sy-

base is losing far more customers to its competitors than it is taking from them—a complete turnaround from a year ago (see chart, page 16). Likewise, the percentage of respondents who listed Sybase as their primary database vendor for the future declined from 11% in the third quarter last year to 8.4% in this year's third quarter, the survey shows.

Sybase executives didn't dispute the survey results. But five months after major financial

UP FRONT

Ouch!

Just when you thought it was safe to start pounding that keyboard, repetitive stress injury (RSI) has bared its teeth again. This time IS falls should pay attention. A federal jury in Brooklyn, N.Y., last week awarded damages—\$5.3 million against Digital—to a user who suffered carpal tunnel syndrome allegedly from using a keyboard. Granted, another RSI case against IBM went the opposite way the very same week (see story, page 4), but the precedent of that substantial damages award is chilling for the computer industry.

Until now, RSI claims have failed to exact a penny of court-ordered damages, despite more than a decade of debate.

IS professionals should worry about this because RSI is a serious issue. The Bureau of Labor Statistics says 45,000 people lost work time as a result of carpal tunnel syndrome in 1995, the most recent year for which there are records. That's a small fraction of the people who would probably claim RSI if they could win damages.

The pain is so agonizing that they wouldn't want to type

ly every day to under surgery just so he can keep working. Those who don't suffer from RSI may dismiss those who do as whiners. But talk to a carpal tunnel syndrome victim, and you will hear a different story. Their fingers sometimes curl so badly as to render typing impossible. And even if they could type, the pain is so agonizing and unrelenting that they wouldn't want to. Such people are good candidates to sue anyone who can be deemed responsible for their condition, including their employers.

So take RSI seriously. Wearing labels, a half-day class, maybe a few hundred dollars' worth of equipment for high-risk employees is a pittance compared with your legal exposure. If employees develop these injuries, it shouldn't be because you failed to do your job.

OPERATING SYSTEMS

Outlook bleak for NASA's Macs as safety concerns are rejected

By Lisa Picardie

MACINTOSH USERS at NASA's Johnson Space Center (JSC), who have been on a year-long mission to save their Macintoshes from being jettisoned, may soon be launching Windows 95 from their desktops.

After a month-long investigation, NASA's Office of Space Flight Safety and Mission Assessment last week rejected arguments from users of Apple Computer, Inc.'s Macintosh that switching to PCs would compromise flight safety.

COST/BENEFIT ANALYSIS

NASA Deputy Chief Information Officer Don Andreotta said the ruling opens the door for JSC to purchase additional PCs—provided that they comply with current regulations and that necessary cost/benefit analyses are performed. JSC already has more than 7,500 PCs.

But Carl Franklin Jr., a NASA contractor, said he disagrees with the ruling and claims there are still potential safety problems associated with forcing users off the Macintoshes.

"Curve-fitting an orbit is not the same as getting your [electronic mail]. Taking people that deal with trajectories and forcing them to use the same computers that are used by the administrative staff is ridiculous. If we screw up, someone could die," Franklin said.

Macintosh users also argue that space flight safety would be compromised because several Macintosh-only databases, including one containing 10 million records on the histories of space shuttle parts, won't run on the PC. These databases are key if there are malfunctions.

However, there are still some issues to be resolved before JSC CIO John Garman can proceed with the move to Microsoft Corp.'s Windows 95. JSC's Macintosh users won a small victory last month when the Office of the Inspector General (OIG) released a report charging that Garman's move to use Windows 95 as the standard desktop platform wasn't cost-effective and didn't take users' requirements into consideration (CW, Nov. 18).

The OIG report also added that "prudent technical and

management judgment was not exercised."

In addition, the OIG determined that Garman's decision to move to a single platform was out of line with NASA's information technology policies that support "the use of both Macintoshes

and PCs." "Basically we endorse heterogeneous environment policies," Andreotta said.

However, the OIG has no enforcement authority, and Macintosh users will have to wait until this week for NASA CIO Ron West's plan of action, which addresses the four recommendations outlined in last month's OIG report. A follow-up report is due March 7, 1997.

PCs TAKE OFF

Hardware at NASA's O facilities

PCs	45,000
Macintoshes	25,000
Units servers	10,000

If West determines that Garman's decision to move to a single Windows platform didn't include all necessary cost/benefit analyses, Macintosh users would be safe for a while.

However, one NASA watcher claimed that if JSC officials want to move to Windows, they can make it happen. In spite of the user uprising.

"Politics inside of NASA are vastly more fierce than outside

Political battles within NASA may determine the future of the space agency's computing

of NASA," said Keith Cowing, president of Reston Communications, which publishes "NASA RIF Watch," an online newsletter in Reston, Va. "Civil servants can use passive resistance. But this issue comes down to being personality-driven, and if someone [in charge] wants to make it happen, it will."

Some JSC insiders, who asked not to be named, allege that in some cases, requirements are being rewritten as "desires" to enable products that don't fulfill requirements to still be purchased.

SHORTSIGHTED

Franklin claims JSC is being shortsighted by factoring in less total purchase price.

"They are picking less-efficient tools, so users 'are caught in a box here. They want users to work faster, better, cheaper but they are giving them worse tools. I'm a taxpayer, so I have no problems with a PC if it will save money. They may be saving money on the actual acquisition of PCs, but over time the support and maintenance costs are higher," Franklin said.

You can't send mail there from here

► Anti-spam efforts hinder E-mail delivery

By Kim Girard
and Mitch Wagner

FOR 11 DAYS in October, Eric Kimminau, an engineer at a Silicon Valley computer manufacturing firm, said he couldn't send electronic mail to any one he knew who uses America Online.

He suspects, from the information included in his returned messages, that he was a victim of an America Online filter set up to prevent so-called spammers, people who blanket users with unsolicited junk messages.

Kimminau isn't alone. Many business and home users believe their mail is being unjustly blocked by online service filters, based on the inappropriate behavior of a few.

In the meantime, the spamming problem is nowhere near solved.

"A lot of nonspammers, including me, have been blocked by individuals because of the reputation of an Internet service provider," said Catherine Hampton, webmaster at Varian Associates, a medical equipment manufacturer in Palo Alto, Calif.

Hampton said her E-mail has been blocked by users who consider her Internet service provider, Best.com, to be a company that tolerates spamming.

Kimminau, whose service provider is Coast to Coast Telecommunications, said he

has since tried to figure out what happened, writing many E-mails to America Online that were answered with four letters.

"I'm definitely not a spammer," Kimminau said. "I know what spamming is, and I know the kinds of problems it causes for [Internet service providers] and AOL and CompuServe.... I would just like to know it's not

MAKING THE BLOCK

America Online offers two tools with the following sections to block out just mail

- 1 Lets members create lists of sites from which they don't want mail
- 2 Enables users to receive E-mail only from those on a specified list; all others will be blocked

going to happen again."

An America Online spokesman didn't address Kimminau's case but said those accused of sending mass unsolicited mail always receive an E-mail warning from the company.

To combat the problem, America Online recently began

to offer PreferredMail, a service that lets customers selectively filter E-mail by using a list of accused spammers.

"We're being very careful about [what is placed on the list]," said Andrew Graziani, a spokesman at America Online in Dulles, Va. "We're basing this on member complaints."

There are two ways to prevent junk E-mail delivery. Mail from certain sites or individuals can be filtered by the client, or America Online can filter mail from suspected spammers at the source.

Although there's a chance that some customers are filtered unjustly, there are usually two sides to a spamming story, said Bob Metcalfe, vice president of technology at International Data Group Inc.

But tackling the spam problem with filters alone isn't the answer, he said. "Portage for every E-mail sent would solve the problem," he said. "One of the problems with things being free is it's grossly overused."

Hampton said it would be a better idea to charge a quarter per unsolicited E-mail and not penalize legitimate users.

An informal online group that Hampton runs from her World Wide Web site discusses how to curb illegitimate commercial use of the Internet without limiting freedom.

"AOL is not the problem. They're one large company dealing with a huge problem," Hampton said.

About two years ago, Joe Love's job was outsourced. And he couldn't be happier.

"I get the feeling... that I am contributing to the bottom line of my company," says Love, a Dallas-area information systems professional who now works at an outsourcing firm.

"I've gone from being part of a cost center to someone who actually generates revenue."

Like many outsourced IT professionals who continue to do the same work at their former employer, Love was suspicious at first and anxious about the motives of his new employer. But he and others have found that outsourced IT professionals can have more fun.

Tools ease NetWare tasks

By Patrick Dryden

NETWARE SERVER administrators can get help automating most file-system management chores across tens or hundreds of systems when two vendors update their tools this week.

Version 2.0 releases of TaskMaster from Avant! Technology Inc. in Austin, Texas, and Snap-

In AutoAttendant from Snap-In Software, Inc. in Tucson, Ariz., boost their ability to schedule and execute the console commands required to maintain servers that run Novell, Inc. NetWare 3.x and 4.x. These three administrators from having to manually manage files, accounts and NetWare Loadable Module (NLM) programs on individual servers.

"Great. We're trying to find tools to help us do more with fewer people," said John Olivas, a network administrator at the information technology center of Phillips Petroleum Co. in Houston.

Avant! TaskMaster can do the following:

- Examine, prune, back up and distribute files.
- Unload NLMs to free memory and reload them when needed.
- Close files, clear idle connections and shut down processes to enable complete backups.
- Do database maintenance during off-hours.

At \$450 per server,

Snap-In's AutoAttendant integrates with Novell's NWAdmin tool to do the following:

- Copy, update and distribute files.
- Designate one server as a reference for replication to the others.
- Compare source and target files before completing an update.
- Synchronize tasks among servers and track schedules to verify task completion or find problems.

AutoAttendant 2.0 costs from \$50 for one server to \$20 per server in a 300-server license.

Trade pact could boost computer sales

By Patrick Thibodeau

COMPAQ COMPUTER CORP. pays more than \$100 million in worldwide tariffs each year. Digital Equipment Corp. paid more than \$30 million in tariffs last year.

But both companies, along with thousands of other U.S. information technology firms, should eventually be free of customs tariffs. That's because the International Trade Agreement (ITA) was approved Friday. Twenty-eight countries have signed it, and six others have pledged to do so.

Ending tariffs on high-technology and telecommunications products will reduce equipment prices in overseas markets and spur sales, several computer industry representatives said.

The agreement "translates into making it easier for customers to buy our products," said Thomas Ehrgood, international trade counsel at Digital.

The U.S., the European Union, Canada, Japan and most of the members of the Asian-Pacific Economic Cooperation forum support the agreement.

The American Electronics Association (AEA) says the U.S. exports about \$80 billion in IT products to countries covered by the agreement. Foreign customers paid about \$5 billion in tariffs.

"All this is good news in terms of additional jobs," said George Soltman, head of the AEA and chairman and CEO of Centigram Communications Corp. in San Jose, Calif. Soltman's company, which makes

communications services and applications, will benefit from the treaty, he said, although the effects will be gradual.

The agreement will phase out tariffs in four steps between July 1, 1997, and Jan. 1, 2000, in almost every high-tech area: computers, printers, fax machines, most electronic office equipment, semiconductors, software, telecommunications and hundreds of other products.

The agreement may keep manufacturers from locating plants in countries with high tariffs to escape those export costs. "It'll enable companies to manufacture more from where they are located, because the trade barriers abroad will be lower," said Robbins Pansake, international trade manager at Hewlett-Packard Co.

Conflicting rulings on carpal tunnel

By Mindy Blodgett
and Robert Scherer

RECENT legal decisions reflect the continuing confusion over workplace ergonomics, repetitive stress injuries and who is ultimately responsible.

In a first-of-its-kind decision, a federal jury in New York last week ordered Digital Equipment Corp. in Maynard, Mass., to pay \$5.9 million to a former systems secretary who claimed she developed serious carpal tunnel syndrome while using a Digital keyboard.

Yet just a couple of days later IBM won a similar case filed by a quit operator who suffered hand and wrist injuries after using the company's keyboards.

The quit operator sued IBM for \$15 million in damages for allegedly failing to warn users of the injury potential, but the New York State Supreme Court ruled against the operator.

APPEAL PLANED

Digital officials sued the company to appeal the decision, while IBM filed the judgment in its case.

There is currently no scientific evidence that links keyboards to repetitive stress injuries but users said regardless of who is at fault, they hope vendors will work harder to introduce better designs.

"I think the vendors should definitely be doing more in this area," said Ron Hawkins, director of information technology at

the asbestos workplace controversy of the Information Age, Hawkins said.

In the absence of vendor action, users are seeking their own remedies.

"A lot of our initiatives have revolved around eliminating repetitive keyboard use," said Frank Amato, manager of business development at Lockheed Martin Services Co. in Richmond, Va. "We are very heavily safety conscious, so it's something our safety manager has been talking about for several years."

Lockheed's Frank Amato: The company has worked toward eliminating consistent keyboard use.

For example, Lockheed replaced a word processing group that spent all day keying in time cards. He said. In its place, the company has an automated time information system in which workers input their own time card information.

In the IBM case, the finding in the company's favor "supports our position that there is no causal link between keyboard use and repetitive stress," said Fred McNeese, an IBM spokesman.

He said that although IBM "follows the scientific studies" in ergonomics, it doesn't plan to start issuing warnings with its keyboards, as Compaq Computer Corp. does.

Marvin Damsell, a professor of ergonomics and a consultant at Miami University in Oxford, Ohio, said he hopes the Digital judgment would prompt vendors to focus on the issue and fuel further research into ergonomics.

While science hasn't proved a link between keyboards and carpal tunnel syndrome yet, science hasn't disproved it either, Damsell said.

"Sometimes I wonder if . . . repetitive stress injuries are the asbestos workplace controversy of the Information Age."

— Ron Hawkins, Millipore

Millipore Corp. in Bedford, Mass. "More and more, as we find ourselves glued to an information appliance, repetitive stress injuries are an issue."

Hawkins said he wants to see keyboards made more sensitive to touch and computers with more sophisticated voice recognition. But he acknowledged the confusion about the issue.

"Sometimes I wonder if people are just moaning about shift or if repetitive stress injuries are

Conflicting rulings on carpal tunnel

By Mindy Bledgett
and Robert Scheier

TWO RECENT legal decisions reflect the continuing confusion over workplace ergonomics, repetitive stress injuries and who is ultimately responsible.

In a first-of-its-kind decision, a federal jury in New York last week ordered Digital Equipment Corp. in Maynard, Mass., to pay \$5.3 million to a former executive secretary who claimed the developed serious carpal tunnel syndrome while using a Digital keyboard.

Yet just a couple of days later, IBM won a similar case filed by a 911 operator who suffered hand and wrist injuries after using the company's AT&T keyboard.

The 911 operator sued IBM for \$17 million in damages for allegedly failing to warn users of the injury potential, but the New York State Supreme Court ruled against the operator.

APPEAL PLANNED
Digital officials said the company plans to appeal the decision, while IBM hailed the judgment in its case.

There is currently no scientific evidence that links keyboards to repetitive stress injuries. But users said regardless of who is at fault, they hope vendors will work harder to introduce better designs.

"I think the vendors should definitely be doing more in this area," said Ron Hawkins, director of information technology at

the asbestos workplace controversy of the Information Age," Hawkins said.

In the absence of vendor action, users are seeking their own remedies.

"A lot of our initiatives have revolved around eliminating consistent keyboard use," said Frank Armijo, manager of business development at Lockheed Martin Services Co. in Richland, Wash. "We are very heavily safety conscious, so it's something our safety manager has been talking about for several years."

Lockheed's Frank Armijo:
The company has worked toward eliminating consistent keyboard use.

For example, Lockheed replaced a word processing group that spent all day keying in time cards, he said. In its place, the company has an automated time information system in which workers input their own time card information.

In the IBM case, the finding in the company's favor "supports our position that there is no causal link between keyboard use and repetitive stress," said Fred McNeese, an IBM spokesman.

He said that although IBM "follows the scientific studies" on ergonomics, it doesn't plan to start issuing warnings with its keyboards, as Compaq Computer Corp. does.

Marvin Dainoff, a professor of ergonomics and a consultant at Miami University in Oxford, Ohio, said he hopes the Digital judgment would prompt vendors to focus on the issue and fuel further research into ergonomics.

"While science hasn't proved a link between keyboards and carpal tunnel syndrome yet, science hasn't disproved it either," Dainoff said.

"Sometimes I wonder if...

Nonprofits rely on IS innovation

► Limited resources spur creative solutions to technological problems

By Jon Chaffetz

NONPROFIT WORK still is an often, undervalued, helping hand and a cup of coffee, but computer technology now has a major part in the effort.

Information systems staffers at nonprofit organizations aren't only planning larger and more costly projects, but they are also working with limited

budgets and resources.

For example, the Atlanta chapter of the American Red Cross has tried a data warehouse that runs on a RIM-based AS/400 system. The data has helped the chapter reduce administrative costs from 24% to 10% of its budget and give the Red Cross information that lets them contact the right people at the right time when disaster strikes.

"All disasters are run on computer now," said the Red Cross chief information officer at the Atlanta chapter.

Groups such as the Red Cross use computers out of necessity because nonprofits deal with funding cutbacks, diminishing government support and increasing competition for donations that exist.

And publicity about hindrance scams makes charities rely on computer technology so they can document how they spend money, according to officials at the National Charities Information Bureau.

But the skills to use most state-of-the-art technology become a liability if nonprofits could transfer it to the business world (see chart).

"We have to be able to talk about what our mission is and how the donated item will help us provide better service," Kell

logg said. The new services from the Red Cross' AS/400 system come through a Web browser.

The drive to deliver on the promise of technology takes on its right and importance, he says, said Doug Barker, CEO of the Nature Conservancy in Arlington, Va. If we give our money better ways to pull in all sorts of information and link the data to geographic information systems, it will be a really smart move.

Barker has begun a drive to work with technology firms to get the best products available. He says an advantage for the Nature Conservancy is that high-tech companies often support conservation issues.

For example, the small Corp. is helping the Office of Productivity in South to Nature Conservancy's offices nationwide.

CREATIVE SOLUTIONS

Another way to get help is to work out a creative donation deal.

Barker worked out an agreement with Learning Tree International Inc. so Nature Conservancy workers receive demand training on a space available basis. Thus, the group gets much needed training while filling up Learning Tree's classes.

Training is a huge focus for

nonprofit groups because users are often uncomfortable with using computers.

For example, Kelllogg made some PCs were installed at Red Cross offices to give users a more intuitive way to access and enter data in to the AS/400, without having to navigate end-user log-based screens.

Major plans, such as the Nature Conservancy's computer technology push or the National Easter Seals Society's linking of its nearly 300 World Wide Web pages, can often take a long time to implement because of the delays in looking for equipment donations.

As a result, these groups may find themselves getting a very

early start with new technical offerings.

"Now that Web technology is affordable, we are like kids in a candy store," said Roger Wellman, CEO at Easter Seals in San Jose, Calif.

Examples include Brian Routh, which used a mental network to improve its donation renewal rate, and Easter Seals, which is testing hardware that lets paraplegic and quadriplegic users control a computer with little or no body movement.

"Sometimes I will pump out on the bleeding edge just because it will take me that much longer to get it done as a profit," Kelllogg said.

SHORTS

NYSE offers E-trade tips

The New York Stock Exchange and Computer Associates International, Inc. will conduct a series of free technology workshops for NYSE-listed companies to teach business people skills such as World Wide Web-based stock trading and electronic commerce. The first workshop is scheduled for Jan. 14-15 at the NYSE. To register, contact Jean Risse-Kubilus at (212) 342-2705 or via the Web at www.cenroad.com.

SAP adds S/390 platform

SAP AG this week will add IBM's S/390 mainframes as a platform for its R/3 database server. R/3 customers can use IBM's DB2 database and take advantage of S/390's clustering capabilities for scalability through the use of parallel systems technology. R/3 will be available next summer for mainframe shops that use the OS/390 operating system.

Ford signs up with Lucent

Ford Motor Co. said it will use Lucent Technologies. Inc.'s recently launched integrated messaging outsourcing service. Lucent will develop technology and

services to support about 50,000 messaging mailboxes at Ford facilities nationwide. Ford will be charged a monthly, per-user fee. The service initially will be aimed at handling voice service, but electronic mail, fax and groupware support is on tap.

Fore buys Scalable Networks

ATM switch maker Fore Systems, Inc. last week acquired Scalable Networks, Inc. in Pittsburgh for \$30 million. Scalable links desktop Fast Ethernet switches and Gigabit Ethernet servers to Asynchronous Transfer Mode (ATM) backbone networks. Fore plans to offer switches that can support additional ports, according to officials at the Warrendale, Pa., company.

Compaq to serve video

Compaq Computer Corp. said it will embed videoconferencing capability in its ProLiant line of servers starting in the middle of next year. Compaq in Houston will use the hardware and software of VideoServer, Inc. in Lexington, Mass., to provide integrated Services Digital Network and Ethernet connections and audio, data and video processing to LANs. Up to eight simultaneous connections will be possible from a network of 48 PCs.

DEC slashes Alpha prices

Digital Equipment Corp. last week reduced the price of its Alpha RISC chips by up to 50% in an attempt to enhance its competitiveness in the Windows NT market. Under the new pricing schedule, a 300-MHz Alpha 21164 chip, previously selling for \$669, will now cost \$395. Similarly, high-end 433-MHz Alpha 21164 chips that formerly cost \$1,492 will now cost \$750.

Intel announces strategy

Intel Corp. this week will announce its three-year strategy for bringing video, electronic mail and three-dimensional graphics to PC users. Intel's first step will be to sign up PC makers to support the Sync DRAM memory standard for dynamic RAM chips.

Cisco gets stake in Interlink

Cisco Systems, Inc. in San Jose, Calif., last week announced it has taken a 9% stake in Interlink Computer Sciences, Inc., a Fremont, Calif., maker of software products for IBM MVS mainframes. They also inked a pact in which they will develop and market a software suite that links MVS mainframes to LAN internetworks.

Nonprofits rely on IS innovation

► Limited resources spur creative solutions to technological problems

By Tim Ouellette

NONPROFIT WORK still involves volunteers, a helping hand and a cup of coffee, but computer technology now has a major part in the effort.

Information systems staffers at nonprofit organizations aren't only planning larger and more wide-ranging projects, but they are also working with limited

budget and resources.

For example, the Atlanta chapter of the American Red Cross has created a data warehouse that runs on a RISC-based AS/400 system. The database helped the chapter reduce administrative costs from 24% to 9% of its budget and gives the Red Cross information that lets them contact the right people at the right time when disaster strikes.

"All disasters are run on computers now," said Dee Kellogg, chief information officer at the Atlanta chapter.

Groups such as the Red Cross use computers out of necessity because competitors deal with funding cutbacks, diminishing government support and more competition for donations than ever.

And publicity about fundraising scams makes charities rely on computer technology to they can document how they spend money, according to officials at the National Charities Information Bureau.

But the skills IS must use to make technology dreams a reality at nonprofits could transfer well to the business world (see chart).

"We have to be able to talk about what our mission is and how the donated item will help us provide better service," Kel-

logg said. "I believe so much in the Red Cross. My passion comes through."

IS dedication is key.

"The drive to deliver on the promise of technology takes on heightened importance for us," said Doug Barker, CIO at the Nature Conservancy in Arlington, Va. "If we give our users better ways to pull in all sorts of information and link the data to geographic information system tools, it really matters."

Barker has begun a drive to work with technology firms to get the best products available. He says one advantage for the Nature Conservancy is that high-tech companies often support conservation issues.

For example, Microsoft Corp. is donating its Office productivity suite to Nature Conservancy offices nationwide.

CREATIVE SOLUTIONS

Another way to get help is to work out a creative donation deal.

Barker worked out an agreement with Learning Tree International, Inc., so Nature Conservancy workers receive donated training on a space available basis. Thus the group gets much needed training while filling up Learning Tree's classes.

Training is a huge focus for

PHOTO BY AP/WIDEWORLD

nonprofit groups because users are often uncomfortable with using computers.

For example, Kellogg made sure PCs were installed at Red Cross offices to give users a more intuitive way to access and enter data in the AS/400, without having to navigate endless test-based menus.

Major plans, such as the Nature Conservancy's computer technology push or the National Easter Seals Society's linking of its nearly 500 World Wide Web pages, can often take a long time to implement because of the delays in looking for equipment donations.

As a result, these groups may find themselves getting a very

early start with new technologies.

"Now that Web technology is affordable, we are like kids in a candy store," said Roger Wellman, CIO at Easter Seals in San Jose, Calif.

Examples include B'nai B'rith International in Washington, which used a neural network to improve its donation renewal rate; and Easter Seals, which is testing hardware that lets paraplegic and quadriplegic users control a computer with little or no body movement.

"Sometimes I will jump out on the bleeding edge just because it will take me that much longer to get it done as a nonprofit," Kellogg said.

Profitable tips

Nonprofit IS managers have this information request: direct on top of their typical IS duties

► These everything about their organization's goals and be able to communicate that to outside groups.

► Have a clear technology plan and detail what each new computer system will do for the staff because the nonprofit often depends on donations.

► Plan for the advance because they can't count on delivery of donated systems on a timely basis.

► Learn to integrate all sorts of systems they receive as donations.

Cisco gets stake in Interlink

Cisco Systems, Inc. in San Jose, Calif., last week announced it has taken a 5% stake in Interlink Computer Sciences, Inc., a Framet, Calif., maker of software products for IBM MVS mainframes. They also asked a price in which they will develop and market a software suite that links MVS mainframes to LAN internetworks.

IBM DB2/Parallel Edition

The TPC-D is the industry standard benchmark for measuring query performance on large complex databases. On the fastest hardware that IBM makes, the RS/6000 SP running against an identical 300 GB data warehouse, Oracle7 Parallel Server's TPC-D performance was almost twice as fast with almost three times the throughput as IBM's own DB2/Parallel Edition. What's even more amazing, Oracle delivered this performance at nearly one-third the price.

Almost 3 to 1 Faster Multi-user Throughput

Almost 3 to 1 Cheaper Price Performance

Almost 2 to 1 Better Single User Response Time

Oracle7 Parallel Server. Call Oracle 1-800-633-1071 ext. 10785, or find us on the Web at <http://www.oracle.com>

Green-light special: IS reviving Kmart

By Thomas Hoffman

WHAT A DIFFERENCE 2 years makes.

Last February, Kmart Corp. was teetering on the brink of bankruptcy, placing strategic technology projects on hold and watching helplessly as valuable information systems executives bolted for the exits [CW, Feb. 5].

Since then, new management has helped the discount retailer turn two consecutive profitable quarters by selling \$1 billion in equity and cutting costs.

And in response to lagging sales, the Troy, Mich.-based company's IS group is spearheading several ambitious technology projects to improve the merchandising mix, draw more customers and pump up revenue (see chart).

Leading the charge is Donald E. Norman, a 25-year retail system veteran who was hired last December. He became senior vice president and chief information officer when CIO Virginia Rago left a year ago.

Norman has assembled an all-star team of industry executives such as Judith Rusch, the former director of IS at The Disney Store; David Guzman, former chief technology officer at Federated Department Stores, Inc.; and Mike Blair, former vice president of operations at Federated's Sabel Group.

Thanks to a three-tiered client/server allocation system it introduced in October in time for the holiday sales crunch, Kmart's buyers can identify and distribute the right merchandise mix more effectively to its 2,616 stores.

"Clearly, if you've got the product in stock, then you can help the customer come back," Norman said.

PAST MERCHANDISING

Kmart has also improved the speed and accuracy of its inventory management systems. Norman said some of Kmart's merchandise can now be replaced in 18 to 30 hours, compared with the 36 to 48 hours it used to take.

In June, Kmart began replacing all of its IBM Cobol and CICS-based financial systems with a suite of client/server systems from Walker Interactive Systems in San Francisco. The new systems, which are being installed on a mix of IBM mainframes and Microsoft Corp. Windows NT systems, are expected to help Kmart close its books just two to four days after the end of each quarter. Norman declined to say how long it now takes the company to close its books.

Kmart has no plans to migrate its Kmart Information Network II systems in its stores from Unix to Windows NT because the Unix systems "still have plenty of horsepower left in them," Norman said.

Kmart has managed to launch all three IS projects after "beaucoup" dollars were slashed from its 1995 IS budget, he said. "We have cut \$500 million out of our expense overhead at Kmart, and a good chunk of that came from IS," Norman said. Analysts estimate Kmart's 1995 IS budget is \$75 million.

Analysts say Kmart is on the right track but still has some distance to close between itself, with 1995 revenue of \$34.4 bil-

lion, and \$500 billion Wal-Mart Stores, Inc. Kmart's merchandise mix "is much better, due to improved merchandising systems," said Robert Berger, principal at Berger Advanced Management Services, a Hillsboro, Calif.-based retail management consultant.

But Wal-Mart "is on the forefront of inventory management and supplier relations. They're

very good at spinning their vendors to make the whole supply chain more efficient," said Jeff Stiel, an analyst at Kurt Salmon Associates, an Atlanta-based retail and consumer products consultancy.

Stiel pointed to Wal-Mart's yearlong Collaborative Forecasting and Replenishment pilot with Warner-Lambert Co. and several technology firms. The ef-

fort was designed to improve forecasting by sharing customer and product information between suppliers and retailers over the Internet. "Wal-Mart is very serious about this investment, and that sends a message to the rest of the industry," Stiel said.

Norman, for one, is listening. "We're not where we want to be, but we're succeeding," he said.

MCI offers faster frame relay

By Kim Girard

MCI COMMUNICATIONS Corp. is boosting its frame-relay speeds and offering a managed frame-relay access device (FRAD) to help IBM SNA users track their service.

High-speed frame-relay that ranges from 3M to 12M bit/sec. is available from MCI's 500 network access points nationwide, MCI announced last week.

Those speeds will provide an alternative to Asynchronous Transfer Mode (ATM) for network managers seeking higher bandwidth to high-traffic sites.

Pricing ranges from \$2,168 per month for a 3.072M bit/sec. port speed to \$5,168 for a 12.384M bit/sec. port speed.

Access to the service is provided by the local telephone company, which uses inverse multiplexing of multiple T1 circuits to provide one circuit that can offer up to 12M bit/sec. speeds.

Although 70% to 75% of all circuits to remote sites are 56K to 64K bit/sec., a large number of companies still require a higher speed link to headquar-

ters, said Tom Jenkins, an analyst at TeleChoice, Inc. in Verona, N.J.

"For companies that have a headquarter site and are using multiple T1 connections, this is a cost-effective solution," he said. "It will save them somewhere between 25% and 30%."

Franssen Technologies Inc. in Lynchburg, Va., saved \$1.2 million last year by converting from leased lines to frame relay, said Terry Hutchens, network engineering manager at the engineering services provider.

WHO NEEDS ATM?

Monthly rates for MCI's high-speed Hypertext Transfer Protocol service

Port speed	Price
3.072M bit/sec.	\$2,168
4.608M bit/sec.	\$3,168
6.144M bit/sec.	\$4,168
7.680M bit/sec.	\$5,168
9.216M bit/sec.	\$6,168
10.752M bit/sec.	\$7,168
12.384M bit/sec.	\$8,168

ter to utility companies. He said the company expects to save another 20% by using single fast frame-relay connections to customer sites instead of multiple T1 lines.

"The thing we like about it is we don't have to change our equipment to ATM or [switched Multimegabit Data Services] to get higher speeds," he said.

Hutchens said the company runs four lines at 3M bit/sec. to customer sites, has tested the service at 12M bit/sec. and is "very satisfied."

Although MFS Communications Co. and LDDS WorldCom, Inc. offer high-speed frame relay, their services are limited. Sprint Corp. is expected to add fast frame relay to its service offerings next year.

On the managed FRAD side, MCI's SNA customers can now purchase, lease or rent Sync Research products from MCI. A managed FRAD provides a single point of contact so customers don't have to manage equipment from multiple vendors. As part of MCI's WAN Managed services, Sync will maintain the FRAD equipment.

Shopping up

Kmart this year has launched a series of information technology projects designed to help the discount retailer cut costs, improve its product mix and draw customers to its stores. They include the following:

- Implemented its in-store development retail stock ledger that is expected to help Kmart more effectively calculate gross profit and other accounting functions. The Universal client/server system will be implemented at the end of January.

- Upgraded to the IBM Inventory Management and Replenishment Decision System and focused the system to shorten the replenishment cycle by a full day. There are plans to shorten replenishment to 36 to 48 hours by the middle of next year.

- Rebuilt out a client/server allocation system to better deal with demand by the right inventory for the right time. Available for key-line items new and soft goods in February.

ASSESS, ANALYZE, AND IMPLEMENT
FOR THE YEAR 2000.

AND WHILE YOU'RE AT IT,
WATCH OUT FOR THE BULL.

Meet your Century Date Change problem head-on with Micro Focus Revolve/2000

A lot of software vendors are charging into the market with Year 2000 "solutions," but look closely—you'll find many are proprietary, incomplete, or make claims you know are too good to be true. With our experience, we know better. Micro Focus Revolve/2000, gives you tangible, comprehensive technology in a

single package that lowers your risk and addresses every step in the process.

First, Revolve/2000's Assessment and Analysis facilities help you quickly identify date occurrence in your applications and automatically locate the source code that needs modification. You'll see precisely which parts need to be changed and get an estimate of the cost and effort required to do it. That way, you'll be in a better position to decide what internal or external resources are needed to get the job done.

Next, its Implementation facilities let you either automatically convert two-digit date fields to four-digit fields or efficiently make source code modifications with its integrated editor.

Then use Revolve/2000's built-in syntax checker to find errors and help ensure clean compiles before testing, either on the mainframe or, more cost-effectively, on a PC with other Micro Focus application development tools.

Nobody else offers anything like Revolve/2000. That's because we're the 20-year leader in tools and services for developing and maintaining legacy systems. We know how to help you avoid stepping in someone else's mistakes.

See For Yourself. Call Micro Focus and order your Revolve/2000 demo disk today. You'll see why it's the only solution you need. Dial 1-800-632-6265 or visit us at <http://www.microfocus.com>.

Revolve/2000 can work with other Micro Focus tools to provide seamless access to host files from the PC

Transforming Enterprise Systems **MICRO FOCUS®**

INTERNET WORLD '96

Microsoft, PointCast team to 'push' Web information to users

By Mitch Wagner

MICROSOFT CORP. AND PointCast, Inc. announced last week that software

for receiving PointCast news broadcasts over the Internet will be included in Windows 95 and Windows NT by next July.

At Internet World '96 in New York, the two companies said PointCast's client software will be part of Active Desktop, next year's version of Microsoft's Internet

Explorer browser. Unlike previous versions of Explorer, Active Desktop will be able to run as the Windows desktop, replacing the usual interface in Windows

95 and Windows NT.

The agreement adds momentum to a medium that was already becoming popular over the Internet: "push-oriented" or "broadcast" technology.

GM's Larry Lozon. Push technology "is like a form of multimedia E-mail."

The idea is simple but powerful: Instead of waiting for users to go to World Wide Web pages on the Internet or an intranet, information systems managers can build pages that push the information from servers to users' desktops.

"It's like a form of multimedia E-mail," said Larry Lozon, senior vice president and director of General Motors Corp.'s Cyberworks business unit in Detroit, which is exploring Internet-based marketing and advertising. "It's immediate. Until now, you had to wait for a user to go back to a Web site for new information. This allows you to send directly to him."

Cyberworks has been testing a push-oriented tool kit from BackWeb Technologies in San Jose, Calif., since September.

The Microsoft/PointCast alliance follows a deal from Netscape Communications Corp. last month to incorporate Castanet push-oriented software from Marimba, Inc. into its upcoming desktop software, Constellation. Marimba is a company in Palo Alto, Calif., that was founded by the inventors of Java.

WHAT'S IN STORE

Right now, the main application for push technology is delivering news and advertising via the Internet. Developers also talk about building intranet applications to push corporate information down to users' desktops.

But those applications are just a sliver of the functionality possible with push-oriented technology, according to Forester Research, Inc., a consultancy in Cambridge, Mass.

In the long term, the technology can be used to push programs as well as text, images and animation down to users' desktops, said Forester analyst John Robb. It is a way to achieve true client/server computing on the desktop, allowing IS managers and software companies to develop applications that distribute themselves so that some processing occurs on the server and some on the client, he said.

InFocus® projectors.
The brightest way to train your users.

Windows NT® 4.0 is finally here. And that's great news, except that no one knows how to use it. We can help.

Start with an InFocus projector. It takes what's on your computer screen and projects it to an entire room full of people. So you can teach everyone in your office how to run a computer again—all at the same time.

And since we're the world leader in multimedia

projection, we have a wide selection of models to choose from. All easy to use. Easy to afford. And they're all ready to project Windows NT 4.0.

Call us, and we'll have one on your desk tomorrow with our Instant Access Rental Program. It'll help keep all that Windows NT training from driving you nuts.

InFocus®

Project now: 3-day rental for the price of 1
1-800-294-6400 or www.infocus.com/cw

Please 1-800-294-6400 for 1-800-294-6400. InFocus® Projectors are available in the U.S. only. InFocus is a registered trademark of InFocus Systems, Inc. All other product or trademark names are trademarks of their holders.

Oracle7

#1 For Data Warehousing

#1 Readers' Choice

Databases Advisor names Oracle7 #1 for data warehousing.

#1 Customer Choice

IDC names Oracle #1 in the worldwide data warehousing market.

Oracle7 has more features for data warehousing than any other RDBMS: parallel query, index and load; bit-mapped indexes; star queries; OLAP integration; and scalability across a range of SMP and MPP systems. It's no wonder that more organizations rely on Oracle, from their largest data warehouses to their smallest data marts. And, it's why more application developers build their data warehouse solutions on Oracle7. So, if fast, accurate decisions are important to your company's performance, call Oracle at 1-800-633-1071, ext. 10345, or find us on the Web at <http://www.oracle.com>

ORACLE®
Enabling the Information Age™

Microsoft, Sun add Java to Web servers

By Justin Hibbard

AVIALS MICROSOFT CORP. and **Sun Microsystems, Inc.** at Internet World '96 last week introduced World Wide Web servers that are the first to support server-side Java applications.

Microsoft announced the immediate availability of Internet Information Server (IIS) 3.0, which includes Microsoft's Java Virtual Machine.

"When you're talking about running across different server platforms, then Java is good. But if you're using NT, all of your other code is reusable anyway."

Chuck Toussieing
principal, Alpha
Information Systems

Not to be outdone by its own technology, Sun's JavaSoft division said its Java Web Server will be available in the first quarter next year and will include support for Sun's Java Servlet application programming interface (API).

PROS AND CONS

Users are divided between the advantages each server offers: the freedom to use any scripting language on Microsoft's server and the ability to run Java programs on any operating system.

Early adopters of the Java Web Server, code-named Jeeves, welcomed the ability to write servlets. Servlets are server-side Java applications that will run with Jeeves on any platform that supports the Java Virtual Machine. But Microsoft users said they are more likely to use the Microsoft server's new Active Server Pages for building back-end applications. An Active Server Page tells the server to build a page that contains specific information requested by a client.

"When you're talking about running across different server platforms, then Java is good," said Chuck Toussieing, a principal at Alpha Information Systems, an Internet service provider in Temecula, Calif. "But if

you're using [Windows] NT, all of your other code is reusable anyway."

Toussieing developed an application for BankAmerica Corp. in San Diego that provides insurance policy quotes to customers via the Web.

He first wrote the application in Microsoft's Visual Basic and compiled it to run on Unix. Since then, he has migrated the code to Windows NT, then to Microsoft's Internet Server API and finally to Microsoft's VBScript, he said.

After he installed the beta version of Microsoft's IIS 3.0, Toussieing embedded the VBScript application in an Active Server Page, which delivers a customized insurance quote based on data provided by the user.

"We've found that, at least for the programmers we have, you can bring someone up to speed on Visual Basic faster than on Java," Toussieing said.

THE VISUAL BASIC CHOICE

Visual Basic's ease of use is one of the most compelling reasons for businesses to develop Internet applications in the language, said Clay Ryder, an analyst at Zonta Research, Inc. in Redwood City, Calif.

"There's a much larger base of [Visual Basic] developers out there than Java developers," he said. "Getting everyone trained on Java is very costly."

But developing server-side Java applications brings savings to companies that build lots of client-side Java apps, Ryder added. "I can develop my client-side code using the same tools that I use to develop my server code," he said.

Java applications written to Sun's Java Server API will run on any operating system when used with Jeeves, which is written in Java and will also run anywhere. Sun officials said.

"[Jeeves] allows me to design code for [a Common Gateway Interface] or business processes across all platforms," said Chris Phillips, senior systems administrator at Canlink Interactive Technologies Ltd. in Kingston, Ontario. Phillips said he has used his servlets on clients' machines, all running different operating systems.

'net commerce faces test

Gerstner tells IS: Challenge is retooling business processes, not technology

By Mitch Wagner, Sharon Gaudin and Barb Cole

NEW YORK

COMPANIES THAT SEEK to do business on the Internet will face a greater challenge in re-engineering their business processes than they will in engineering new technology, said IBM Chairman Louis V. Gerstner last week.

"If hundreds of millions of people are going to do online banking, banks are going to have to change the way they operate," Gerstner said. He delivered the keynote address at Internet World '96 here.

To succeed online, companies will have to devote large numbers of personnel to service online customers, he said.

NO LOYALTY

Eric Kestler, director of systems planning and technology at Phillips Business Information, Inc. in Potomac, Md., agreed. "Everything is speeded up—the consumption of the product and service is instantaneous," he said. "And if you don't cater to the customer, they'll go elsewhere. There's no loyalty on the Internet."

But Michael Martin, a financial consultant at Smith Barney, Inc. in New York, said he hasn't seen much business re-engineering in response to the 'net.

He said his clients are more informed because of the information they collect from the Internet. "The fundamentals of investing aren't going to change."

he said. "But our clients are becoming more sophisticated. They understand technical factors of investments because the Internet has really educated them."

But internally, some people are still trying to get used to the technology, Martin said.

Smith Barney a few weeks ago launched a World Wide Web site (www.smithbarney.com) that offers clients individual portfolio information, stock news and research.

Similarly, L. L. Bean, Inc. has yet to reshape its business practices in response to the growing interest in online shopping, according to Steve Roberts, senior new media analyst at L. L. Bean in Freeport, Maine.

The outdoor clothing and equipment giant started to offer electronic commerce Nov. 25 by putting 350 of its nearly 8,000 products online. It has nearly doubled its sales forecast for December, and Roberts credits some of that to the new site.

IN THE PLANE

Technology is still necessary for Internet success, and Internet World visitors were shown a host of new technologies:

• **Lotus Development Corp.** announced general availability of its **Genexus 4.5 Web server**, which costs \$995, and beta availability of **Webmaker**, which releases data into Internet applications in Web browsers. Webmaker will ship by March.

• **Microsoft Corp.** said a public beta of the **Internet Explorer for Exchange 3.0** is available for downloading from the Web. The Exchange upgrade is expected by March.

• **Oracle Corp.** said its **WebCenter** and **WebServer** were still in beta, but **WebCenter** will ship by March. **WebServer** will ship by March.

• **IBM** announced that **OpenView**, a cross-platform, object-oriented monitoring tool, is adding **Windows** support. OpenView was designed to be cross-platform but has been slow to add support for the most popular platform—Windows.

• **Intel** said it will be releasing **IntelNet**, a new Java program, during the week of the show. IntelNet will be a Java program, running up with new online capabilities, IntelNet will be the browser, monitoring and administrative program at Internet World.

Suite hands intranet workflow to users

By Justin Hibbard

OPEN TEXT CORP. last week unveiled the second version of its intranet application suite, which lets users create and manage their own workflow processes.

LiveLink Intranet Suite 7 lets end users create a home page for their projects by clicking a button that builds links to a threaded discussion page, a document management library, a workflow diagram and a search engine. Project managers can add users, set permissions and

administer the site through a World Wide Web browser.

"It's really taking very sophisticated workflow and pushing down a lot of the logic to the user," said Ian Campbell, an analyst at International Data Corp.

LiveLink releases information systems staffers from having to administer each workgroup's intranet site and lets IS control the network, Campbell said.

Scott Chate, collaboration and document management group leader at TransCanada PipeLines Ltd. in Calgary, Alberta, said his company plans to mi-

grate from the proprietary version of LiveLink to the intranet version to give more users access to the system.

"We're looking at the new intranet version to provide some additional capabilities and to increase our ability to include other parties through the concept of an extranet," Chate said.

Chate said managers at his company realized the power of an intranet when they used a threaded discussion board to prepare for a meeting of far-flung executives.

You have to migrate your company's entire system to 32-bit.

All within a ridiculous timeframe.

Maintaining application compatibility.

Keeping within allocated budget.

SERVER PLATFORMS

Vendor migration push may trip users

By Jakeman Vignani

USERS SHOULD beware of vendors that are trying to push them into migrating to new server platforms.

The emergence of WinNT as an enterprise-capable platform and performance gains from inexpensive commodity components are putting pressure on Unix and proprietary server vendors to shift business models.

And that could prompt vendors to force painful platform migrations on users in the next few years, according to a report released recently by Gartner Group Inc.

TURNABOUT

"Traditional IS in the data center did not have to worry about long-term investment protection or architectural disruptions. But all that is about to change very quickly," said George Weiss, vice president of

SERVER ISSUES

In the next five years, these will be the top five considerations for choosing a server:

- Performance and scalability
- High availability
- Software availability and vendor enthusiasm
- Level of integration required
- Architectural longevity

Source: Gartner Group Inc., Stamford, Conn.

distributed computing platforms at Gartner in Stamford, Conn. In fact, corporations should plan for no more than three to four years of architectural continuity in server platforms, Weiss said.

"Vendors on large part are re-spreading to what they feel is the marketing push from other companies," said Brian Cutler, a systems manager at the State University of Albany in New York.

They don't want to be perceived as being in the market with yesterday's software running on yesterday's hardware," Cutler said.

NT FOCUS

The Gartner report comes at a time when nearly all the major Unix and proprietary server vendors are focusing product development and marketing muscle on Microsoft's Windows NT.

This rapid shift to an NT-centric strategy could lead to the placement of inadequate resources on existing platforms, the abrupt dumping of current product streams and confusing integration strategies, according

to analysts. Other vendor actions that analysts said could trip users include the following:

- Migration and application availability issues caused by the move to 64-bit architectures and mainframe-class servers by some Unix vendors.
- Attempts to mold Unix and Intel Corp. architectures such as the joint Hewlett-Packard Co. and Intel Merced chip.

analyst at Summit Strategies, Inc. in Boston.

As a result, it is critical for corporations that plan server migrations to ensure that their vendors offer secure binders to move applications among platforms.

SCALABILITY

It is also important to ensure that servers have the scalability to handle mixed and increasing workloads, according to the Gartner report (see chart at left).

Such issues are a long-term concern for us," said Gary Spencer, an information systems director at Black &

Docker Corp. in Memphis.

"But we don't see them as being an imminent problem for us right now," Spencer said.

Black & Docker runs most of its Unix servers on HP's Unix servers. Spencer said those servers should run for at least another three years or so.

Therefore, any server migration issues that are likely to arise won't happen before then, he said.

Typically, vendors "don't want to be perceived as being in the market with yesterday's software running on yesterday's hardware."

— Brian Cutler, State University of Albany

• Vendor attempts to push new and commercially untested Intel-based enterprise servers with technologies such as Non-Uniform Memory Access, symmetrical multiprocessing and clustering.

"We are at a point in time where the WinNT architecture is increasingly being viewed as a viable alternative" for enterprise applications by users and vendors, said James Greene, an

Analysts: Software costs sap sysplex savings

► Mainframe hardware clustering savings may not be enough

By Tim Chaffetz

AS BIG-BROEN users tie their mainframes together with new clustering technologies, vendors are starting to make sure their software can take advantage of the extra processing capability.

Mainframe clustering, called parallel sysplex, promises to cut back on user hardware costs by allowing incremental upgrades of processing power.

The clusters use newer CMOs, or an "ooled" mainframes that take up less space and have lower maintenance and energy costs than traditional water-cooled systems.

But users must watch software costs because of the need to upgrade certain pieces of software to meet clustering requirements.

And in some cases, software

licensing fees are higher as more vendors move to MIPS-based pricing.

"I call it the CMOS tax," said Mike Egan, an analyst at Meta Group Inc. in Stamford, Conn. For high-end users, the increases — especially in third-party mainframe software pricing — could wipe out IBM-based hardware savings, he said.

USER INTEREST

Even with the software cost issues, analysts said there is a steady build-up of user interest and installation success with parallel sysplex (see chart).

User sites such as Mellon Bank Co. and Edmonston Telephone & Telegraph claim increased capacity and lower costs.

But some users are taking a wait-and-see approach

to make the software transition to parallel sysplex as smooth as possible vendors have announced the following plans.

• **Neon Systems, Inc.** in Sugar Land, Texas, in January will ship Affiliates Server for CICSplex. The software lets CICS transaction applications work in a parallel sysplex without any reprogramming.

• **Hogan Systems, Inc.** in Dallas next fall will release a version of its financial transaction software that was specifically designed for parallel sysplex environments.

• **Hitachi Data Systems Corp.** in Santa Clara, Calif., last week announced an MVS-based software auditing service that promises to cut licensing costs by identifying unused MVS software licenses across a network.

Though not targeted at mainframe clusters, the Hitachi service could help users negotiate more favorable software licensing deals before moving to par-

allel sysplex. Egan said he recommends such an approach to avoid increased MIPS-based pricing.

Nine major software vendors, including Computer Associates

et, according to Annex Research in Phoenix.

Applications have to be updated for parallel sysplex because most packages aren't geared for multiple processors.

MOVING IN PARALLEL

Estimates of how mainframe shops are involved with parallel sysplex:

Level of involvement	Number of sites
May install parallel sysplex	5,000
Committed to parallel sysplex	1,200
Have installed parallel sysplex	400
Perform complete data sharing	60

Source: Annex Research, Phoenix.

International, Inc. and Boole & Babbage, Inc., have made or will make their packages, parallel sysplex-ready, according to IBM officials.

ALL THE PARTS

A typical parallel sysplex installation features three or four mainframes and has about 1,200 MIPS of processing power.

For example, some CICS transactions take the same route through the CPU — called affiliates — every time, said Joe Bak, ex-president of Neon.

Neon's Affiliates Server simply removes the region boundaries from those affiliates so CICS transactions can be routed to the least busy processor without expensive reprogramming.

A typical parallel sysplex installation consists of three to four mainframes and about 1,200 MIPS of processing power, according to Annex Research.

SERVER PLATFORMS

Vendor migration push may trip users

By Jitkumar Vijayan

USERS SHOULD BE wary of vendors that are trying to push them into migrating to new server platforms.

The emergence of Windows as an enterprise-capable platform and performance gains from inexpensive commodity components are putting pressure on Unix and proprietary server vendors to shift business models.

And that could prompt vendors to force painful platform migrations on users in the next few years, according to a report released recently by Gartner Group, Inc.

Analysts: Software costs sap sysplex savings

► Mainframe hardware clustering savings may not be enough

By Tim Chutele

AS BIG IBM users tie their mainframes together with new clustering technology, vendors are starting to make sure their software can take advantage of the extra processing capability.

Mainframe clustering, called parallel sysplex, promises to cut back on user hardware costs by allowing incremental upgrades of processing power.

The clusters use newer CMO5, or air-cooled, mainframes that take up less space and have lower maintenance and energy costs than traditional water-cooled systems.

But users must watch software costs because of the need to upgrade certain pieces of software to meet clustering requirements.

And in some cases, software

licensing fees are higher as more vendors move to MIPS-based pricing.

"I call it the CMO5 tax," said Mike Egan, an analyst at Meta Group, Inc. in Stamford, Conn. For high-end users, the increases — especially in third-party mainframe software pricing — could wipe out IBM-based hardware savings, he said.

USER INTEREST

Even with the software cost issues, analysts said there is a steady build-up of user interest and installation success with parallel sysplex (see chart).

User sites such as Mellon Bank Co. and Edmonston Telephone & Telegraph claim increased capacity and lower costs.

But some users are taking a wait-and-see approach.

To make the software transition to parallel sysplex as smooth as possible, vendors have announced the following plans:

• **Neon Systems, Inc.** in Sugar Land, Texas, in January will ship Affinities Server for CICSplex. The software lets CICS transaction applications work in a parallel sysplex without any reprogramming.

• **Hogan Systems, Inc.** in Dallas next fall will release a version of its financial transaction software that was specifically designed for parallel sysplex environments.

• **Hitchiti Data Systems Corp.** in Santa Clara, Calif., last week announced an MVS-based software auditing service that promises to cut licensing costs by identifying unused MVS software licenses across a network.

Though not targeted at mainframe clusters, the Hitchiti service could help users negotiate more favorable software licensing deals before moving to par-

allel sysplex. Egan said he recommends such an approach to avoid increased MIPS-based pricing.

Nine major software vendors, including Computer Associates

et al., according to Annex Research in Phoenix.

Applications have to be updated for parallel sysplex because most packages aren't geared for multiple processors.

MOVING IN PARALLEL

Estimated number of moving steps are based on parallel sysplex.

Level of involvement	Number of sites
May install parallel sysplex	5,000
Committed to parallel sysplex	1,200
Have installed parallel sysplex	400
Perform complete data sharing	60

Source: Annex Research, Phoenix

International, Inc. and Babbage, Inc., have made or will make their packages parallel sysplex-ready, according to IBM officials.

ALL THE PARTS

A typical parallel sysplex installation features three or four mainframes and has about 1,200 MIPS of processing power.

For example, some CICS transactions take the same route through the CPU — called affinities — every time, said Joe Baker, president of Neon.

Neon's Affinities Server simply removes the region boundaries found in those affinities so CICS transactions can be routed to the least busy processor without expensive programming.

To reach thousands of new customers, MCI began with one call. To Sybase.

Sybase IQ

How do you gain a competitive advantage? By being first to market with products and services customers want. Ask MCI, whose ability to satisfy customers is turning the tables in telecom marketing. Thanks to Sybase IQ, MCI's Small Business Unit rapidly implemented a distributed datamart to transform mountains of available data into targeted market segment campaigns. As a result, MCI launches their campaigns into the market with lightning speed while their competitors are still retrieving data. "Sybase IQ's

phenomenally quick response time lets us implement new ideas in days instead of weeks," says Scott Barnes,

"with precision and flexibility we'd never come close to before." Speed and agility are merely part of the edge

Sybase offers businesses today. To take the first step in exploring the possibilities,

visit www.sybase.com/mci. Or dial 1-800-8-SYBASE. That's how it all begins.

Sybase users are losing confidence in its turnaround

CONTINUED FROM PAGE 1

losses led to a management overhaul they stressed that a more aggressive company will finally emerge early next year.

Even customers who remain committed to Sybase want to see that happen.

Sybase "made a lot of mistakes, and it's taking them a long time to regroup," said Alan

standing by Sybase's SQL Server database, which runs its ticketing and subscription systems. But the Jacksonville Electric Authority in Florida is no longer an Sybase faithful.

The utility switched to Oracle as its database of choice and plans to move applications off SQL Server, said Chuck Jensen, director of information systems.

Jacksonville Electric soured on Sybase because of performance problems with the notorious SQL Server 12.0 release and the vendor's failure to keep to a promised schedule for fixing them, Jensen said.

"It doesn't look real good to your CEO and other executives when you don't meet your commitments," he said.

Despite such misgivings, the utility still gave Sybase a chance to compete against Oracle and other vendors for an integrated database/application software

purchase this fall.

"But they didn't really express an interest, while Oracle was hanging our doors down," Jensen said.

i Robert Epstein, executive vice president at Sybase, acknowledged in an interview this month that the company isn't "getting growth from the SQL Server business primarily because we've spent all of our time focused on the installed base as opposed to finding new customers."

CHANGES IN THE WINGS

It could take another 18 months for Sybase to rid itself of the image fallout resulting from the SQL Server 12.0 problems and three straight quarters of losses this year, Epstein said.

But he and other executives said Sybase is finally almost ready to replace its traditional "stealth marketing" with a more aggressive approach. The new approach will be accompanied by better integration of the company's databases, develop-

THE GOING GETS TOUGH

ment tools and middleware.

Sybase will take a small step this week by bundling the Windows NT version of SQL Server with World Wide Web development software and other tools.

A top-to-bottom strategy announcement is expected next month or in early February.

Other products on the horizon include a Web application server code-named Jaguar, middleware that links Java apps to multiple databases and Unix versions of the SQL Server bundle.

But the strategy is taking a long time to gel, leaving Sybase "kind of a no-show" in new markets such as the Web, said Stan Dolberg, an analyst at Forrester Research,

Inc. in Cambridge, Mass.

"When you're basically a better-mouse-trap company and you don't have a new mouse-trap to fall back on, you're really hard-pressed," he said.

Sybase's products remain solid, "but the perception is that they're on a downward slide," said Joe Dorocho, chief information officer at Hilton Hotels Corp. in Beverly Hills, Calif.

The problems at Sybase made it tough to persuade Hilton's management to stick with SQL Server when the company reviewed its database choice last summer, he said.

Oracle's campaign to cast doubt on Informatica flat with some users. Page 55

Levine, director of information services at McCarter Theatre, a group of 11 arts organizations in Princeton, N.J.

In the meantime, rivals such as Oracle Corp. and Informatica Software, Inc., "have done a really good job of exploiting Sybase's difficulties," he said.

The arts organization is

Vendors' PowerPC strategies rest with fate of Mac OS upgrade

By Lisa Piccirilli

ANALYSIS

BURNING WINDOWS NT ON POWERPC chips was expected to be the savior of the PowerPC platform. But now it is unclear whether PowerPC backers IBM and Motorola, Inc. will even continue to offer that option.

An estimated 4.2 million PowerPC-based desktops will ship this year, according to International Data Corp.

The uncertainty may clear up — for both users and vendors — when Apple Computer, Inc. unveils its Macintosh operating system strategy Jan. 7.

The PowerPC Platform, formerly known as the Common Hardware Reference Platform (CHRP), was supposed to support multiple operating sys-

tems, including Apple's Mac OS, Microsoft Corp.'s Windows NT, Sun Microsystems, Inc.'s Solaris and IBM's AIX.

Because Apple leads the PowerPC charge, with 90% of PowerPC system sales, it seems that PowerPC partners IBM and Motorola are stuck on hold until Apple reveals its plan.

The lack of a mass-market operating system has delayed delivery of CHRP systems until the middle of next year. They were originally due the middle of this year.

The delay cost Apple one of its biggest users. Lockheed Martin Missiles & Space stalled a move to Windows for more than a year because it was waiting for CHRP.

But this month the Sunnyvale, Calif., aerospace giant — with more than 9,500 Macintoshes — decided to phase out the Macintosh.

Lockheed would not be standardizing on NT if Apple and come out with CHRP two

POWER AHEAD

What's ahead for the PowerPC Platform

January	Apple will announce Mac OS strategy
March	Apple's System 7.6 for CHRP ships
Mid-1997	First wave of CHRP machines ships
Late 1997	PowerPC-based Java Virtual Machines due

years ago when they first predicted it would be out," said Mike Bailey, a systems analyst at Lockheed.

"CHRP would have taken the market by storm back then. But now NT on the PC has thousands of applications, and NT on the PowerPC has virtually none. That makes NT on CHRP irrelevant and not mainstream," Bailey said.

To date, Apple has failed to deliver a Mac OS version that runs on CHRP, although it is expected to ship a PowerPC version of System 7.6 in March.

Beyond that release, most

users and industry watchers bet Apple will buy or license Be, Inc.'s Mac OS operating system and meld it with parts of Apple's stalled Mac OS project, code-named Copland.

A REAL CHOICE

The result would be Apple's next-generation Mac OS for the PowerPC, which could be a powerful alternative to Windows NT on both the Intel and PowerPC platforms.

Because IBM said Motorola is shipping PowerPC machines running NT, Apple's potential support of the BeOS

could throw a monkey wrench into their NT plans.

IBM has found that sales of its AIX-based PowerPC RS/6000 products make up 90% of its sales.

But the low demand for NT on IBM workstations — coupled with Apple's potential move to the BeOS — may force IBM to halt its support for NT on PowerPC, IBM sources said.

"IBM is in a quandary," said Jim Garden, an analyst at Technology Business Research in Hampton, N.H.

"It's very unclear what will happen to NT on PowerPC. If Apple puts all its force behind Be, then IBM will have to join in," Garden said.

Because Motorola is the main PowerPC chip maker and sells most of those chips to Apple, it has little to lose no matter what Apple decides.

But if Apple goes with the BeOS, the Motorola Computer Group's sales of NT PowerPC computers could decline, observers noted.

One-stop shop for app tools

CONTINUED FROM PAGE 1

N.H. "Not one person can learn all these different environments. To get a distributed, single development environment would save huge amounts of time and money."

Obeys estimated that he could save 30% to 40% of his application-building time by using one integrated environment.

"Four-wheel drives are better in the woods, and race cars are better in the streets. No one tool is good at everything," he said.

LESS TO LEARN

Dan Budimir, a senior software engineer at AlliedSignal Aerospace in Columbus, Md., said having an integrated environment would mean less training — and fewer training expenditures — for his developers. "A consistent user interface is a great advantage," Budimir said. "It's like asking my employees to learn [just] Spanish compared to asking

"A consistent user interface is a great advantage."

**— Dan Budimir,
AlliedSignal Aerospace**

them to learn Hindi, Spanish, French and Latin."

Sources familiar with Microsoft's plans said the environment will have a common look and feel for many aspects of the development process, including class libraries and graphical development tools. Developers, for instance, would use a common graphical tool to build applications. When they move on to language-specific tasks, such as writing a complex routine in algorithms, they could then use the language of their choice, whether it is Visual Basic, C++ or Sun Microsystems, Inc.'s Java.

Without an integrated environment, developers have to work with a specific tool for the graphics creation and then write the code in another language.

MORE CONTROL

David Kelly, an analyst at Hurwitz Group, Inc. in Newton, Mass., said if Microsoft can make this work, developers could have better control over their projects.

"If all the code is unified with common libraries and graphics components, it's easier to leverage it across projects and increase [software component] reuse," he said.

David Lingren, director of advanced development at DunaGate, a subsidiary of The Dun & Bradstreet Corp. in New York, said Microsoft has been heading in this direction by increasingly tailoring development tools to mirror one another.

"They have been moving, in a number of releases, to try to bring the integrated

development environment into a common look and feel," Lingren said. "It's a consistent way of looking at source code, of browsing through OLE objects, a consistent code editor."

Microsoft's Internet Studio, released in October, came close to this by offering an integrated environment in which to write World Wide Web applications. The new environment, however, wouldn't be

limited to the Internet.

Developers said the benefits are more than saving time and money.

"It's about flow. It's creativity," said Pat Torrey, an engineer and owner of Four-square Solutions, a development company in Derry, N.H. "You have to get your programming done when the juices are flowing. You don't want to have any artificial interruptions. Usually switching languages does that."

CLO ROU FYI

YOUR DATA WAREHOUSE IS READY.

As an intelligent business person, the prospect of building a data warehouse probably makes three words leap to mind: Expensive. Slow. Risky.

But you can't afford to put it off. You need access to critical information, now. You need answers, now. You need DataStage, from VMARK.

With a suite of powerful graphical tools, DataStage simplifies and automates the key stages of

warehouse development: extraction, transformation, integration and movement. So that corporations of all sizes can create data marts and warehouses with remarkable speed.

And that brings three much more words to mind: return on investment.

For a DataStage preview, and information about VMARK, check out www.vmark.com/datastage.

about

what a **database**

can't do.

INFORMIX-
Universal

INFORMIX-Universal Server is a single, fully integrated, high-performance relational database engine for all datatypes.

The age of database limitations is over. Informix has broken down the barriers between the traditional text/numbers relational databases you're familiar with, and the new datatypes you're excited about, with the new INFORMIX®-Universal Server. And it's paving the way to new applications that will make your whole company more efficient and more competitive.

This is the first universal server truly worthy of the name. Because its exclusive DataBlade® technology lets you integrate any kind of data — text, images, multimedia, geo-spatial, Web pages, time-series, whatever — *into a single database engine*. So you can take advantage of all the different data you have or want, all the time. And use it in applications that improve everything from the way you track your business, to how well you serve customers, to how fast you bring new products to market.

And INFORMIX-Universal Server is available right now — along with dozens of DataBlade modules, to help you innovate your business, get ahead of the competition, and stay ahead. Call 1-800-688-IFMX, ext. 81, for a complete information packet about INFORMIX-Universal Server and DataBlade technology.

Or visit us on the Web at www.informix.com.

And start thinking about what your database can do: give your business a competitive edge.

Server.

Mylex-embedded storage devices make RAID grade

By Matt Hamblin

MYLEX CORP. plans to announce three RAID storage control devices today, two that it hopes will be embedded for the first time by server makers.

Adaptec, Inc. in Milpitas, Calif., also is working on a variation of the same em-

bedded technology. But Mylex in Fremont, Calif., seems to be the leader in the market for RAID controllers, said analyst Jim Porter, president of Dusk/Trend, Inc. in Mountain View, Calif.

Storage control devices currently are sold as add-in boards to nearly all server manufacturers and integrators.

It's probably a very good competitive move, since Adaptec has been moving in the same direction," said Phil Devin, a chief analyst at Dataquest in San Jose, Calif.

Users will benefit from the technology being embedded in servers because it will be easier and possibly cheaper

to move to the RAID format. Mylex officials and analysts said.

The Mylex announcement shows that RAID technology for backup of data is pervasive and should become more so with embedded RAID devices, analysts said.

"There was zero RAID in 1990, but in six years, 70% to 75% of servers on enterprise system networks have RAID capability. The trend is continuing upward so that we'll approach 95% by the end of the century," Porter said.

It is partly because of RAID's dominance that Mylex developed the embedded controllers, company officials said. Having embedded controllers in PC servers could be a strong motivation to cost-cutting manufacturers, Porter said. But Devin said manufacturers might not adopt the Mylex technology unless it provides "really great cost savings."

The Mylex products will be available early next year, but Porter said the embedded products might not be in servers for a year or two. Mylex plans to include a next-generation add-in controller board, the DAC960PC, that can be used for all server levels. It will cost up to \$1,350 for a three-channel configuration.

The DAC960PC would be used in entry-level to midrange servers. It will cost \$950. The other embedded controller, called Rome, would be used for mid-range and some enterprise servers, and will cost roughly half the price of the DAC960PC, company officials said.

Calling all webmasters

By Patrick Thibodaux

A FEW DAYS AGO, Bob Koche sent out electronic-mail invitations to the first meeting of the Webmasters' Guild Bay Area chapter to be held on Dec. 18. He was overwhelmed. "It was like one of those movies where they bring in the bags of mail to the courtroom," said Koche, chapter president. "We filled our meeting room in three days."

The nonprofit, Cambridge, Mass.-based Webmasters' Guild was organized in 1995 to establish professional standards and set policies on the legal, ethical and technological issues that affect webmasters. The group doesn't charge dues, and it doesn't restrict its membership to people with specific job titles. "The ultimate goal is to truly represent the voice of the webmaster community, the webmaster profession," said Matthew Cutler, the group's founder and president.

The guild has roughly 1,500 members through its mailing list. The Bay Area chapter will meet at Netscape Communication Corp.'s office in Mountain View, Calif. The guild's World Wide Web address is www.webmaster.org.

Mergers. Acquisitions. Reengineering. It's all part of doing business today. That's why the software you choose is important. Make sure it will help you adapt to change, not stand in your way.

Some software is not designed for change. Its rigid structure can't be adjusted easily. Then there's PeopleSoft. PeopleSoft believes change is not only inevitable, but can also be an opportunity. That's why PeopleSoft designed its software to accommodate change quickly and easily.

Only PeopleSoft offers PeopleTools. With these unique software tools, modifying or reorganizing is just a matter of pointing and clicking. Change is easy because PeopleTools

eliminate the need for detailed programming, armies of outside experts, or vast technical knowledge. All of which reduce your implementation and long-term maintenance costs.

And, unlike some software, PeopleSoft is portable, so you can change your database or hardware at any time.

If you believe in embracing change rather than avoiding it, perhaps PeopleSoft should be your software. You'll discover we have the technology, the people, and the commitment it takes to make that belief a reality.

To find out more about PeopleSoft, give us a call at 800-947-7753 or visit us at www.peoplesoft.com.

manage your workflows

collaborate in real time?

Introducing Livelihood™ Intranet Suite 7.

*It's the first and only intranet application suite
that you can run your business on.*

Managing today's complex business processes means allowing your managers and project teams to access, share, track and reuse information across your corporation - no matter how many sites and technologies are involved. With Livelihood Intranet you can manage documents, collaborate on projects and coordinate workflow. And quickly find what you need using the world's top-rated full-text search engine. It links your people with people, and people with information, to meet your goals.

Livelihood Intranet is a complete off-the-shelf application that you install and start using right away - all your people need is a Web browser. It takes your current investment in networks, databases and applications and integrates them with the Internet's global infrastructure. Finally, your intranet will support document collections of any size and handle any number of users. All with the necessary security and access control.

Industrial-strength and scalable, Livelihood Intranet helps Fortune 500 and Global 2000 companies solve advanced business problems.

And it's the only one that can, and the only one that's shipping today. Contact us and we'll show you how.

*"Livelihood was exactly
what our company was
looking for...we looked
at a lot of products and
of all of them, Livelihood
was the most open and
easiest to use."*

Aussie vendor offers scalable directories

By Barb Cole

DATA CRAFT LTD. last week announced a suite of directory service products aimed at companies that seek to track large numbers of users in a corporate address book.

The Australian company, which previously sold its directory to OEMs in its native land, is moving into the U.S. market. By doing so, the company will go head-to-head with X-500 heavyweights such as Control Data Systems, Inc., ICL Enterprises, Inc., Unisys

Corp. and WorldTalk Corp.

DX500 OpenDirectory complies with the Lightweight Directory Access Protocol and is based on X-500, an international standard that defines how information is tracked in messaging directories.

Despite an early lead
in technology, will
America end up playing
second fiddle?

America's IT industry. The best in the world. But we're throwing away our leadership. Because our knowledge and skills aren't being passed on to enough of our young people. Tech Corps gives your corporation a vehicle to change that. By supporting a grassroots effort to enhance teaching and learning through technology. And give students the skills they need to keep our country number one. Discover the rewards of becoming a Tech Corps Corporate Sponsor. 808-620-7751 • <http://www.utsi.org> America needs to know.

Organizations already providing cultural enrichment in schools
include: Tech Corps, the National Science Foundation, the National Endowment for the Arts, the National Endowment for the Humanities, and the National Endowment for the Arts.

What are your X500
standardization plans for
the coming year?

Purchase
33%

Based on 100 responses from X500 users

Source: The Directory Group, Inc., Palo Alto, Calif.

DX500 uses a SQL database to track user names and associated information and can return entries from large directories in just a few seconds, users who have developed enterprise directories around the software said. In contrast to the SQL approach, most X-500 offerings use a flat-file system that can get bogged down when it is loaded with names.

"We did some benchmarking [of X-500 directories], and [DX500] came out on top," said Max Montanaro, manager for electronic commerce services at Optus Communication Ltd., a telecommunications company in Sydney, Australia. Optus is tracking about 30,000 entries in a directory that is the basis of an electronic commerce service aimed at businesses.

SCALABILITY ISSUES

Montanaro said the telecommunications firm's benchmarks show that DX500 will scale to support up to millions of entries.

Directory scalability is becoming more important as information systems shops seek to build directories over the Internet that include listings from trading partners and other sources.

"[Datacraft] has focused on a key issue surrounding X-500 — performance," said Nina Burns, president of Creative Networks, Inc., a consultancy in Palo Alto, Calif. Building an X-500 directory on top of a SQL database makes sense, Burns said.

Besides improving performance, the DX500 product could address another key issue with X-500 directories, users said. Typically, it is difficult to modify the format of directory entries once the directory is built, Montanaro said. But because it is based on SQL, DX500 is flexible in this regard, he said.

The DX500 directory is available now and costs \$24,000 per server.

Welcome to the New Dimension in Data Discovery

SAS Institute Introduces the First Integrated Data Warehousing and OLAP Solution

Featuring a Powerful Data Server and Easy-to-Use Data Browser

With SAS Institute's new client server OLAP solution, you can reach through your massive data stores to **visualize detail data on any aspect of your business**. It's never been easier to spot trends, generate forecasts, and gain a greater understanding of your customers, competitors, or current business direction.

Our new multidimensional database includes an integrated data server and browser... plus a viewer for surfacing that data right on your desktop. And it's at the core of SAS Institute's OLAP solution — which is fully integrated with the award-winning SAS® Data Warehouse for managing, organizing, and exploiting your data... a client server environment...and a web enabler.

Explore All the Possibilities in Our Free OLAP Guide.

Be a part of the future of data discovery right now through our free OLAP Guide. Just give us a call at 919.677.8200 or send us E-mail at cw@sas.com

Shareholder value fuels Du Pont's \$4B, 10-year outsourcing deal

► Company hopes to pump savings into new business ventures

By Thomas Hoffman

AS PART of its push to double shareholder value by 2000, The Du Pont Co. last week announced plans to outsource its global information systems and technology infrastructure.

In what analysts have described as the largest outsourcing deal to date, Andersen Consulting and Computer Sciences Corp. (CSC) will split the 10-year, \$4 billion job.

When Du Pont earlier this year announced plans to explore IS outsourcing, Chief Information Officer Ginda A. Hallman said the company regarded its IS operations as best-of-breed and wanted any vendors it selected to deliver more than just information technology services.

Du Pont wants a return on IT equity, said Christian Meyers,

an analyst at Ga Research, Inc. in Mountain View, Calif.

Hallman said the deal is expected to reduce Du Pont's IS costs by between 5% and 10%—considerably less than the cost savings of between 15% and 20% typically generated in mega-outsourcing deals. That is largely because Hallman was able to reduce IS expenses by 40% in the past three years.

"We expect to achieve a much higher degree of variability" on IS costs, said Hallman, who went to great lengths to avoid the word "outsourcing."

Hallman said she hopes the alliance with CSC and Andersen will let Du Pont cut its IT costs and pump those savings into new businesses where it continues to diversify, such as those in the Pacific Rim.

"We're all the way to having a Hoiers store in China. That's

much different" than our past approach of making only low rate materials, Hallman said.

STAFF MIGRATIONS

Under the deal, which will take effect in the second quarter of next year, Du Pont will transfer 2,600 of its 4,200 IS employees to CSC. The El Segundo, Calif., systems integrator, which has acquired Du Pont's 13 data centers under the agreement, will migrate the chemical and energy giant's 30 business units to SAP America, Inc. R/I business software.

Another 500 IS staffers will be offered positions with Andersen, which will develop chemical and energy applications for Du Pont.

About 1,100 IS professionals will remain at Du Pont to manage the relationships with CSC and Andersen and develop core

applications, such as process monitoring, research and development, and selected business programs.

The Du Pont deal is unique in that the Wilmington, Del.-based company will assert strong managerial control over all IT decisions carried out by the vendors.

"It appears that Andersen and CSC will remain suppliers, cooperators and competitors for new business," under the Du

Pont agreement, said George Logemann, an analyst at The Yankee Group in Boston.

About \$400 million of Du Pont's \$690 million IS budget will go to CSC and Andersen. The rest will be used to pay its remaining staff and support the application development it is retaining.

Over the length of the agreement, \$550 million will go to Andersen and \$545 million to CSC.

"We never have enough SAP skills."
—GINDA A. HALLMAN
CIO DU PONT

Security experts warn of Christmas Day hack attacks

By Patrick Thibodeau

THE SAN DIEGO Super Computer Center (SDSC) isn't expecting a jolly man bearing gifts to come down the chimney on Christmas Eve.

Instead, the agency anticipates an increase in "doorknob twisting"—attempts to achieve what hacker Kevin Mitnick did on Dec. 25 two years ago.

Mitnick allegedly broke in to computer security researcher Rutomero Shimamura's computers at the SDSC. The SDSC monitors its computers 24 hours a day, but Shimamura's computers weren't part of the SDSC security system.

TRYING OUT THE GIFTS

This year's break-in attempts will begin in earnest at roughly the same time hackers are probably bringing their new Christmas gifts on line.

"We definitely see increases on the holiday, beginning on Christmas day at about 3 p.m. Eastern Standard Time," said Thomas Hutton, network and

security architect for the super-computer center.

But Hutton, along with others involved in computer security, isn't surprised by the doorknob twisting on holidays when many systems administrators are on vacation.

"I would imagine that there is probably more [physical] burglary during holiday periods as well," he said.

A San Diego Police Department spokesperson agreed. The holidays do spur a "marginal increase" in burglary, he said.

Computer networks and World Wide Web sites may be at greater risk of attack from hackers during long holiday periods, according to a number of computer security professionals.

Their supporting evidence isn't based on statistics, surveys or reports; it's anecdotal, gut feeling and experience.

The lead anecdote is the Shimamura break-in, followed by the network break-in at General Electric Co., also that year.

The gut feeling is similar to what some police officers and

nurses say about a full moon: "They will tell you for sure that the night of the full moon is when they're busy," said Richard Power, a senior analyst at the Computer Security Institute in San Francisco. The holiday break is "the cyberspace equivalent of that," he said.

The fear of holiday vulnerability is also grounded in crime-fighting experience.

"People who tend to break in to systems are going to try to do it when they're not going to get caught, and clearly, if network administrators are on vacation it lessens the opportunity of getting caught," said Jim Settle, a retired FBI agent who headed the National Computer Crime Squad from 1993-94 and now

runs an information security firm in Springfield, Va.

But Settle said his experience with the FBI shows that 80% of all computer break-ins go undetected by network administrators.

Many companies do little to protect their data or check audit logs for unauthorized network access, he said.

Security tips

WATCH LOWE'S ASSAULTS ON CHOCOLATE

"There is no absolute about security."

Santa isn't the only one with a list to check this holiday season. IS workers should make sure they aren't leaving any presents for hackers: easy access to their company's systems.

"There is no absolute about security, but there are a lot of things you can do to make a hacker's life difficult," said Yan Choi, director of network security at Walsh-Lewis & Associates in Hoboken, N.J.

Choi has developed a list of security vulnerabilities and suggestions in large would-be glitches at key.

One major point of network vulnerability is holes in electronic mail systems. E-mail programs should be updated to the latest versions, and the most recent security patches should be downloaded. Another vulnerability is servers that don't require passwords. Choi suggests installing routers and firewalls to guard against address spoofing and encryption programs to thwart "sniffer" programs. Other security recommendations include the following:

► Turn off unnecessary computer options that are often turned on for easier installation.

► Recognize that network administrators aren't necessarily security experts.

► Be wary of "free" security programs that hackers have used to attack other systems.

—Patrick Thibodeau

Introducing the new record holder in database performance on an NT Server.

TPC-C benchmark results based on client/server application performance on a Compaq ProLiant 5000/1200 Model 2 running Microsoft Windows NT Server 4.0

*Oracle 3956 tpmC benchmark based on Windows NT 3.51 on Compaq ProLiant 4500/133 Model 20x. Informix OnLine 7.3 \$100/tpmC available 2/1/97.

Microsoft SQL Server 590 tpmC available 12/1/96. Oracle 7.3 \$198/tpmC available 6/30/96.

INFORMIX®- OnLine Workgroup Server. Proven the best database for Windows NT®.

In the most recent TPC-C benchmark, INFORMIX-OnLine Workgroup Server set the all-time performance record for databases running on a Windows NT Server. Higher than anything Microsoft or any other vendor has ever achieved. And while the Windows NT world may be surprised, we're not.

Speed is just one measure of the power of the OnLine Workgroup Server. It's also completely Web-ready with Netscape®'s industry leading software, cross-platform compatible with UNIX, and has replication and system management built right in. No other vendor can match that performance, either.

And for all that power, it's still easy to install, easy to configure, easy to use, and easy to administer. Not to mention easy to afford. And since it's built on Informix's exclusive Dynamic Scalable Architecture™, it can grow to accommodate any size department.

But don't just go by the numbers. Go by experience.

Visit our Web site at www.informix.com/wgs and download the OnLine Workgroup Server for a free 60-day trial. Or call 1-800-274-9464 and ask for it on CD. And set a few workgroup performance records of your own.

IT'S AN INTERN
IT'S A FILE AND PRINT

The most predictable thing about business is that it's unpredictable. Your needs are likely to be different from one day to the next (or for that matter, from one department to another). You either need a range of servers to accommodate all your different needs. Or one affordable server with a very wide range.

Introducing the new Compaq ProLiant 2500. Simply put, it's the most versatile platform available today. Its modular chassis lets you easily swap components to meet any new set of requirements. So you only need to purchase for your needs today. And as your

ET SERVER. IT'S AN APPLICATION SERVER.
SERVER. CAN AN IDENTITY CRISIS BE A VIRTUE?

business grows, the Compaq ProLiant 2500 provides the scalability to go from file and print to Internet or application server. While giving you the availability and management features you need to run your mission-critical applications. And with Distributed Access, the information you need will always be close at hand.

In other words, it's the first platform that's versatile and flexible enough to run your business on—today and tomorrow. To find out more about the ProLiant 2500 or Distributed Access, visit us at www.compaq.com/us, or call 1-800-319-7778 to locate the Compaq reseller near you.

COMPAQ

Has It Changed Your Life Yet?

Computer Industry

Briefs

Bentzen in limbo

Adding software maker Bentzen International, Inc. last week said it expects to report an operating loss of between \$4 million and \$6 million per quarter for the next six quarters, as a result of about \$15 million in legal costs for the quarter ending Dec. 31. The anticipated loss stems from Bentzen's failure to ship new products in the quarter and slow sales of existing products, officials said. Bentzen is Santa Valley, Calif., also will be in court cases associated with its November acquisition of Cytec International Corp. and for repossessing certain sales during the quarter. Due to ongoing sales this year, Bentzen had off 100 people, or 15% of its workforce, in October. The company will continue such restructuring in the new year, officials said.

Microsoft buys two

Microsoft Corp. has bought two companies, a developer of shareware World Wide Web management and configuration products, for \$20 million each, CMC Information Systems, Inc., a strategic investment and development firm in Andover, Mass., has filed a copyright lawsuit in Santa Valley, Calif., against Microsoft. Microsoft will integrate NetCart's Webshopper into Microsoft's BackOffice. Webshopper was designed to give users an interactive, structured view of any Web site.

Two for Three

Two corporations that went bankrupt last year will adapt their software management software from Tech Systems, Inc. Tech is still a management software developer in Austin, Texas. Microsoft International, Inc., a \$3 billion technology industry leader in Washington, is looking to reduce the costs and overhead from distributing frequent software updates to users from Texas. And Microsoft, Inc. is in partnership with Tech, wants to look for client/server systems management software by reengineering management for cost-effective, automated control.

Rivals manage merger

Boole & Babbage to acquire Maxm

By Patrick Dryden

BOOLE & BABBAGE, INC. last week announced plans to acquire competitor Maxm Systems Corp. to strengthen its argument that do-it-all suites aren't the only choice for controlling distributed networks and systems.

By issuing stock worth nearly \$45 million, Boole & Babbage in January will take over its smaller rival in McLean, Va.

With combined sales of \$220 million, Boole & Babbage will head the \$300 million enterprise event management market, which is expected to triple by 2000, according to International Data Corp. (IDC) in Framingham, Mass.

"This sounds good to have a larger firm backing Maxm," said user James Brown, senior vice president of network plant facilities at NationsBank in Charlotte, N.C.

This portion of the overall enterprise management market involves tools that keep operators from being overwhelmed by thousands of messages from diverse devices. The tools track events, filter out redundant messages, correlate and prioritize data for operators, then automate many actions.

Boole & Babbage secured a dominant position in that enterprise event automation market "for a surprisingly low price," said Paul Mason, an analyst at IDC.

Objective Systems Integrators in Folsom, Calif., is now Boole & Babbage's most significant competitor, he said.

Vendors whose enterprise management platforms offer event correlation and automated response capability include Bul Information Systems, Inc., Computer Associates International, Inc., Hewlett-Packard Co., Seagate Enterprise Manage-

"Users tell us they prefer a handful of best-of-breed vendors."

Paul Newton, CEO
Boole & Babbage

ment Software, Inc. and Tivoli Systems, Inc.

But those making the most noise — CA and Tivoli — have yet to prove they can handle the diverse input that IS managers need, Mason said.

"Maxm and Boole were really the two leaders who could deliver availability management across any platform, from mainframes to minis and all the networks in between," said John Lewis, vice president of technology delivery at First National Bank of Maryland in Baltimore.

"Others like CA and Tivoli are still only talking about this capability," Lewis said. His bank uses Maxm/Enterprise to sort out alerts from an SNA network, modems, multiplexers, automated meter machines and various computer systems.

Boole & Babbage said it will support Maxm/Enterprise customers and predicted a merger with its Command Post.

The sale will give Boole & Babbage no

many high-profile customers that Maxm/Enterprise won't go away soon, said Joe Soldovilla, automation project manager at Pacific Gas & Electric Co. in San Francisco. But Soldovilla said he is concerned about how many Maxm Systems developers will stay on board and when he will see promised new support.

1997 PLANS FOR BOOLE & BABBAGE AND MAXM

JANUARY

- Complete acquisition
- Announce company integration plan
- Merge sales forces

FEBRUARY

- Meet MAXM Systems customers on 16-city tour

MARCH

- Outline product convergence plan

APRIL

- Present product road map at combined user group meeting

MAY

Motorola pulls the plug on wireless devices

By Mindy Bledges

TWO YEARS AFTER it launched the Envoy and Marco wireless communicators, Motorola, Inc. is ceasing to manufacture them.

Tim McCarthy, a senior business manager at Motorola's Wireless Data Division in Schaumburg, Ill., last week said resellers were told late last month that the company would phase out the devices.

"We will continue to sell and supply the devices, predominantly to vertical markets," McCarthy said. "But we will no longer make the [personal digital assistants] branded with Motorola's name."

McCarthy wouldn't say how many devices Motorola sold, but sources said the company probably shipped fewer than 3,000.

McCarthy blamed the latest generation of personal digital

assistants (PDA) — including the recently announced devices that support Microsoft's Corp. Windows CE operating system — for the demise of the wireless communications line.

"This next generation of PDAs is getting more and more sophisticated," McCarthy said.

To cash in on the hype surrounding the Windows CE devices, McCarthy said Motorola will "ratchet up" production of its wireless modem cards, which give wireless communi-

cations capabilities to the Windows CE handheld computers.

Iain Gillon, an analyst at International Data Corp./Link in Austin, Texas, said the Envoy and Marco failed to catch on because "they just weren't needed. I think they got caught by a market that never materialized."

Gillon also said the devices, which cost close to \$1,000, "were way too expensive."

Steven Boulet, editor of the "Mobile Data Report," an industry newsletter in Alexandria, Va., said the devices were "too large and unwieldy. People want something they can put in their vest pocket."

McCarthy said Motorola doesn't plan to produce a new line of handheld computers, but William Prezza, an analyst at Wireless Computing Associates, Inc. in Yardley, Pa., said it is too early to count out Motorola. "Hardware is what they do," Prezza said. "They'll probably release something soon."

The Envoy was launched in February 1995, the Marco in April 1995 and the Envoy 150 in April of this year.

A Message from
Computerworld and Database Decisions

Welcome to the 1996 Client/Server Middleware™ Road Map

Computerworld and Database Decisions are proud to bring you this resource as you implement and manage your organization's client/server infrastructure.

This road map is an infographic guide to understanding the framework and product components necessary for successful development and deployment of enterprise-wide distributed computing.

Published by Computerworld, with content provided by Database Decisions, the 1996 Client/Server Middleware™ Road Map is the second in a series of three road maps that explain the multi-tiered structure and the products involved in client/server application development. The Client/Server Above™ Road Map was published in August 1996 and a third map, The Internet/Intranet Webware™ Road Map, will be published in 1997.

As the newsworthy for information technology leaders, Computerworld is committed to serving your complete informational needs on IT. This road map, along with the editorial found each week in our newspaper, serves to assist you in making critical resource choices on distributed computing.

Through consulting and lecturing, Database Decisions helps businesses adapt to new technologies by establishing realistic goals and visions that can be shared by both IT professionals and end users.

We hope that you find this road map a valuable asset for decisions on client/server application development and we look forward to bringing you further special focus information.

Sincerely,

Michael R. Rogers

Client/Server "Middleware"-Road Map

developed by
Jeff Tash, Database Decisions

Middleware is the magical software glue that connects clients to servers. It's literally the slash (/) in the term client/server.

At 30,000 feet, client/server is trivial - clients issue requests for services and servers respond to requests. The devil is in the implementation details.

An organization's client/server infrastructure is made up of dozens of different types of hardware and software products. The problem is trying to figure out which ones to use for which tasks. That's where the Client/Server Middleware Road Map helps out.

The Client/Server Middleware Road Map is a visual *infographic* wall poster that helps demystify the complexity surrounding client/server computing by providing a framework that describes the numerous different categories of client/server tools. This framework helps I/T professionals think about and talk about various product offerings, thereby reducing the risk of erroneous product comparisons between "apples" and "oranges."

mainframe, UNIX, NT, Windows, Notes,
the Internet...looking for a way to

tie them all together
without reinventing the wheel every time?

Now it's time to check out Candle's middleware solutions for IBM's

platform. Together, they provide the simplest, most reliable links
between different platforms.

With Candle's Solutions for Networked Applications,

you can be confident

you're maximizing MQSeries' powerful messaging potential. Because

only Candle offers you everything from design by the world's leading

MQSeries experts to training, testing tools, deployment, security and

management solutions for your networked applications.

So let's get rollin'

www.candle.com

Middleware

Middleware makes the network completely transparent to the application developer. With middleware, programmers can write software using a single, universal set of application programming interfaces (APIs) that can be executed anywhere, despite a heterogeneous computing environment and/or multiple, disparate data sources. Without middleware, developers must write expensive, unique code to handle all possible combinations of back-end processing environments.

Middleware products fit into three categories of services:

1. **Distributed Services**
2. **Message Routing**
3. **Application Partitioning**

Distributed Services provide facilities for an integrated set of Directory and Security services.

Message Routing supports the time-delayed, store-and-forward transmission of data files, especially e-mail documents.

Application Partitioning deals with controlling the portion of executable transaction logic that resides on the client, and the portion that runs on the server. Transaction management can be provided by either a DBMS (i.e., *TP Lite*) or a TP Monitor (i.e., *TP Heavy*). Applications can be partitioned based on: the "fat" client model (data-oriented), RPCs (function-oriented), MOMs (event-oriented), ORBs (object-oriented), or the "thin" client model (screen-oriented).

DEAR LOUISE: My son-in-law is the kind of person who keeps dropping by without calling first. Then he won't leave. He's a nice guy—some kind of computer manager—but he won't stop talking. Night after night, it's "distributed environments," and "legacy systems" and "networked computing." He's obviously troubled and looking for answers, but I can't help. I'm in laundromats. How do I get my life back?

LOSING MY PATIENCE

DEAR LOSING: Be gentle, but be honest. Your son-in-law needs serious help. If you're not up to becoming an overnight expert in his field, try tacking a note to your door: "www.usnews.com/electrified." That's where he'll find instant access to all kinds of information about how other companies dealt with similar problems and found ways to run their businesses better. Or try earplugs.

DEAR LOUISE: I am a professional with years of experience. When I read to my son-in-law,

for the

IBM

"Ware" do you want to be today?

The Client/Server Middleware Road Map is part of a series of infographic wall posters developed by Jeff Tash of Database Decisions and published by Computerworld. This road map covers:

Clientware

client apps - e.g., word processors, spreadsheets, graphics, web browsers, etc.

Serverware

server apps - e.g., RDBMSs, TP monitors, e-Mail servers, web servers, etc.

Middleware

tools that facilitate seamless any-to-any interoperability - masking differences or incompatibilities in network transport protocols, hardware architectures, operating systems, programming languages, database management systems, remote procedure calls, object request brokers, etc. (see Middleware panel)

Manageware

intelligent agents, managers, and consoles for managing enterprises, networks, systems, databases and applications (see Manageware panel)

Other members of the Client/Server Road Map Series include:

Aboveware

software development tools responsible for building the added-value applications that run on top of middleware (see Client/Server Aboveware Road Map)

Webware

software products that enable the Internet/Intranet to be used as an organization's client/server infrastructure (will be published in 1997)

(pa-tā'to)

Manageware

Manageware is a fully distributed client/server application for collecting management data, configuring devices, and capturing events. System administrators sit at a console and execute management applications that monitor and control:

- **network devices** (e.g., topologies, modems, routers, hubs, bridges, gateways, etc.)
- **operating systems** (e.g., workstations, file servers, communication servers, printers, etc.)
- **"layered" systems software** (e.g., DBMSs, TP monitors, E-mail post offices, message transfer agents, message queuing managers, etc.)
- **applications** (e.g., financial systems, manufacturing systems, human resource management systems, etc.)

All of the above require various management services such as performance monitoring, troubleshooting, remote configuration, and security auditing. Traditionally, management functions were provided by single-purpose management applications. More popular today are suites of tools that plug-and-play together in management frameworks that feature:

- a **consistent graphical user interface** across multiple management applications
- a **common information repository** for storing shared management data

Virtually every management platform uses SNMP (Simple Network Management Protocol) or CMIP (Common Management Information Protocol) to communicate between distributed agents and the shared management data repository.

Without a recognized standard, some things just aren't the same. In Middleware[®], the standard is INTERSOLV DataDirect. You might even be interested to learn that INTERSOLV owns the term Middleware itself. Maybe that's why more than 160 industry partners, including most of the major names in software, are connected by DataDirect. To learn more, call 1-800-876-3101.

**Hey, throw me
the flying disk.**

When one brand name becomes the standard, anything else just doesn't sound right. In Middleware®, the standard is INTERSOLV DataDirect. In fact, we own the term Middleware itself. Which might explain why we were the first with server-based Middleware, cross-platform ODBC, and the first with a JDBC to ODBC bridge. To learn more, call 1-800-876-3101.

The other is information. Because no bank moves a single dime without it. And helping clients manage information—not just process it—is what Unisys does best. That's why Unisys is the choice of the world's most intensive users of information—including

41 of the top 50 banks. Our solutions help clients with everything from stopping check forgeries to integrating global networks. And our consultants help businesses uncover revenue potential hiding in customer data. It's all part of information management—our way of helping you

One of them is money.

use information as an asset to gain competitive advantage. Call for details and learn what clients like Union Bank of Switzerland learned. When it takes information to run your business, it takes Unisys to help you run it better. <http://www.unisys.com> or 1-800-874-8647, ext. 222

UNISYS

When information is everything.

EDITORIAL

As simple as ABC? Help! I've read too much

management psychobabble, and I can't get up.

After reviewing 10 years' worth of articles, columns, newsletters and reports on being a successful IS executive, one thing hit me: Most "experts" and writers tell you there's a sure-fire secret for success. They make it sound as simple as a preschooler's alphabet book. So I tried to come up with one, and sure enough...

- is for Aligns with the business
- is for Builds relationships
- is for Change agent
- is for Demonstrates ROI
- is for Educates upper management
- is for Fires incompetents
- is for Good with people
- is for Hires smart people
- is for Innovative
- is for Listens well
- is for Juggles many roles
- is for Knows technology
- is for Manages expectations
- is for No technobabble
- is for On time, on budget
- is for Politically savvy
- is for Quality systems
- is for Responsive to users
- is for Strategic thinker
- is for Team player
- is for Understands the business
- is for Visionary
- is for Works well with users
- is for xCuteous
- is for Yes! a positive attitude
- is for Zaps IT costs

If you believe wisdom can be freeze-dried, pin this list of ABCs to the wall. Or give it to a preschooler. The IS profession needs fresh talent. But if you think the

real world is no nursery school, be skeptical about those best-practice-monsters. Pay more attention to the demands, successes and idiosyncrasies of the people around you: staff, management, customers,

peers. Unless you work in a madhouse (and some of us do), the real management experts are the people you manage.

Alan E. Alter

Alan E. Alter, Senior editor, Managing internet: alan_alter@cw.com

Second-guessing network operating system review

I DON'T WANT to come off like some operating systems fanatic, but where did you get the reviewer for your network operating system Buyer's Guide? "Change is coming." CW, Nov. 4)

NetWare and OS/2—No. 1 and No. 2 in market share—got less column space than Windows NT. NetWare's only weakness was "lags as an applications server." OS/2's weakness was "lacks platform support."

Excuse me, but doesn't NetWare have the same weakness? Overall, NT's weaknesses ("lacks directory services, poor systems management support") are more glaring problems.

OS/2's grades were 53 and 45 across the board, whereas NT's were a 72, 75 and 45. The where-to-deploy advice for OS/2 was enterprise-wide, especially for remote sites. For NT, it was for departments and small divisions only.

But where did (writer Lynda Raschowski) get the advice about deploying OS/2 only to large IBM installations? My site runs LAN Server 4.0 servicing Windows 3.1, Windows 95 and OS/2 desktops without a problem.

Nel Zampella
Bellefonte, Ill.
nelz@accessnet.net

THE COMPUTERWORLD SURVEY of network operating systems is the third article on network operat-

ing systems I have read recently in

IS publications. All three articles recommended that Microsoft Windows NT should not be used in mission-critical applications. Since NT is marketed as a premier database server network operating system, I would like to know what types of database applications are considered "noncritical?"

John Lambert
Director of information services
Trans Registry
Miami

jlambert@registry.net

With PCs, what happens if the file server goes down?

I HAVE BEEN reading, with much amusement, all the hype and fury about the network computer. The idea of thin-client computers

on the desks of corporate America sounds wonderful. Everyone wants to get into the act of creating the one and only network computer, which everyone else is going to buy.

But why would anyone in their right mind want to have a device on their desk that depends on a file server to run its applications? What happens when the file server goes down—and says down for a day or 30?

No work gets done.

I'm sure corporations that embrace network computer technology are thinking hard and long about the implications of what happens when the server decides it's going to take the next day or two off. Do they have hardware backups to hand out to their work-force? Or do they let everyone go

home for the day?

The network computer is just a glorified dumb terminal that will run Java or whatever new programming language or operating system is in vogue this week. I'll stay away from using one or even recommending it.

Daniel S. West
PC analyst
Chicago

Hubba-hubba, that's one sexy PDA you've got there

GENERATED at personal digital assistants (PDAs), but I list for one of those new \$500 handheld PCs ["Microsoft OS inspires handheld PC makers," CW, Nov. 11].

I'm tired of spending \$150 for a notebook battery that runs down in a year whether I use it or not. Handhelds' AA or rechargeable

batteries promise 10 hours of service instead of two, for a few bucks instead of hundreds. And the ability to practically touch-type notes and write memos attracts me a lot more than a coat-pocket fit.

The next cyberrevolution will be financial

H. Eric Firdman

Shortages. Poor service. Crumbling infrastructure. These phrases are usually associated with an economic failure, such as in the former Soviet Union. But soon they will describe in the same way a vital part of the world's largest free-market economy—the U.S. telecommunications system.

The system has already suffered some minor strokes from clogged arteries. The Internet is the source of the arterial sclerosis. In one recent and dramatic example, 16% of calls interrupted through a Silicon Valley switch during peak evening hours failed because of Internet traffic.

The growing population of cybernauts—which is estimated at 25 million to 30 million—requires far more capacity than the population of regular telephone users. A Pacific Bell study timed the average Internet surf at 20.8 minutes, compared with 3.8 minutes for an average phone call. And 10% of Internet calls lasted six hours or longer. As usage

New Internet pricing schemes are needed to fix the nation's crumbling network infrastructure

gains, capacity strains.

This will only worsen with the advent of capacity-hungry multimedia applications and entertainment appliances, such as Sony's WebTV. The appliances are touted as "Internet for the masses." But the system isn't ready for the masses. Its performance is already compromised.

Expanding capacity is technically possible. But who will pay for it? The Internet is too unstable economically to sup-

port such investment. There are currently about 1,600 Internet service providers; unfortunately, the business is unprofitable for many of them because of irrational pricing.

Instead of charging according to usage, the service providers use a flat monthly fee, usually \$19.95. Excluding marketing and overhead costs, an Internet service provider can break even at that fee only if the average consumer's daily online use is less than 40 minutes. But given the exponential growth of time-consuming Internet applications, even the modest Internet user soon may become a moneylosing proposition. In essence, the service providers are sacrificing profit for growth.

What keeps the Internet afloat is huge investment by telecommunications giants and highly publicized stock offerings by Internet service providers. Capital markets are so excited about the Internet that they provide more cash for its operation than users do. The major providers collectively raised more capital between 1993 and 1996 than their total revenues in the same period. That bubble has to burst.

One alternative is for the Federal Com-

munications Commission to impose metering of local calls. Other countries have done this for years, but Americans regard unmetered local calls as their birthright.

A better choice is more rational pricing by the private sector.

One model is usage-sensitive pricing, which combines a flat monthly fee with additional charges for those who spend a lot of time or use a lot of bandwidth. Another model is priority-based pricing, in which customers who want faster or more reliable service pay more.

Service providers also could offer value-added services. Customers who want real-time audio and video could pay to have the resources reserved in advance. And providers could let customers rent software for network-centric computing. That will become popular in the next two to three years and will create excellent money-making opportunities.

The result will be greater profitability for the Internet industry and more choices and better service for users. Then, providers will be able to establish rational economic order and prevent gridlock on the information superhighway.

Firdman is a senior consultant at American Management Systems, Inc. in Redwood City, Calif. His Internet address is efirdman@mail.amsinc.com.

Much to learn from our tribal elders

John Gantz

As I looked out at the crowd, I thought, "Uh oh, how's this going to go?" I had volunteered to chair the last session at Comdex, a discussion on the impact of the microprocessor in the next 25 years. After all, this was the microprocessor's 25th anniversary.

There I was, standing at the podium, wondering what a bunch of middle-aged white guys—some of whom aren't going to be around and none of whom are likely to be major players in 2021—could offer a packed house of Iona programmers, young IS professionals, up-and-coming industry executives and fresh-faced reporters.

As it turns out, more than I thought. Maybe there's a reason most cultures revere their tribal elders. Bob Spinnard, vice president of technology strategy at Xerox, and for many years head of Xerox Parc, pointed out that the combinatorial equations are so complex that predicting the future with any kind of specificity is impossible. But then he noted that in a few years, disk-storage advances will let us carry in our pocket the digital record of

all the books we've ever read. Long before 2021, we'll be able to carry all the movies and TV shows we want, not to mention our own personal histories. This vision extends the idea of smart cards by several decimal points.

Next was a prediction from Ethernet inventor Robert Metcalfe, who said the network computer concept will prevail. He said we'll all be connected to one another and have access to all the information we can handle—and plenty we won't.

Network computers will come in all shapes and sizes; maybe they'll be the players for the storage devices we can keep in our pockets. But Metcalfe expressed some doubts that low-earth orbiting satel-

lites, such as Motorola's Triduum project and Microsoft's TeleSight project, will be the network of choice in 2021. For one thing, Metcalfe said he was worried about what would happen if all those satellites fell out of the sky.

Another tribal elder, Tony Oettinger, from Harvard's Program on Information Policy, suggested that the next great advances in computing will come from biomedicine. Rather than try to get today's computers to think like humans, we can take what we're learning about the human brain and redesign computers from scratch, he said.

Besides the natural fit between human data processing and electronic data processing, this is the field currently most rich

in basic research funding.

The audience also chipped in their predictions for IS professionals. The consensus was that even though the use and deployment of information technology would be democratized, with end users managing and processing their own information stores, there always would be room for technical high priests. Why? Because making systems simpler to deal with requires an order of magnitude more complexity. There's got to be a wizard who pulls the levers behind the curtain.

One of the biggest questions went unanswered—would all the software components of 2021 bear a Microsoft logo? The combinatorial equations are too complex.

But as Oettinger pointed out, when the microprocessor was invented, IBM had a greater share of the industry market than Microsoft has today. In short, the tribal leaders agreed, anything can happen.

Gantz is a senior vice president at International Data Corp. in Framingham, Mass. His Internet address is jgantz@idcresearch.com.

Even in 25 years, we'll still need technical wizards to pull the levers

Ruffled feathers in the training nest

Of course classroom training ranks low with users ["Winging it," CW, Oct. 24]. Most trainers are doing it wrong. Problem No. 1: Lack of a sound methodology. Training companies still haven't learned that lecture-heavy press-the-keys training doesn't work.

Problem No. 2: Generic, off-the-shelf training that doesn't fit the needs of specific users. CyberSkills has separate classes for new users and students who know a similar program. This is obvious, but we can't find anyone else who does it. Similarly, if one-on-one sessions or group Q&As would be better for some users, give them that. These are skills-and-needs assessment issues, that, for reasons of cost or ignorance, buyers and sellers of training are reluctant to do.

Problem No. 3: Classes that are too long. Easy answer: Divide all classes into half-day rather than full-day sessions.

Problem No. 4: Poor training manuals. Most are designed for in-class but not for postclass use, despite claims to the contrary.

Your article stated that "the role of training needs to change." Not at all. The way training is designed, delivered and purchased has to change.

Paul Reali

President

CyberSkills Computer Training Centers
Winston-Salem, N.C.

I am writing to protest the misleading and fallacious Page 1 teaser in the Oct. 24 issue. "Are software training classes

for the birds? Your users think so." The so-called survey in the article did not even include software training classes. Training seminars were attended to frequently, but never defined productively. Training seminars are not hands-on; they are product overviews with a speaker. The "nontraditional methods" championed by the author—particularly experiential and asking co-workers and friends—are in fact the least productive. Experimenting presumes that the user has plenty of time and no pressing work to do. Asking co-workers presumes they have nothing better to do either.

Jim Kimmel

Micro Computer Solutions

Louisville, Ky.

jkim@titanic.com

Thank you for the "Winging it" article regarding favorite learning methods for PC users. Your article reflects two major findings. First, the favorite learning preference of PC users is software experimentation. Second, PC users value asking direct questions and receiving quick answers from other experienced users.

But how does the real learning environment operate? Users prefer experimenting with software but rarely have the time. And although PC users have their preferred learning styles, their managers/IS directors face the budgetary constraints of providing cost-effective training.

Did your article ruffle some feathers in the training community? My training

Giving our new look the once-over

REGARDING Computerworld's redesign (which I want to quote an age-old adage [which most chief information officers should memorize]: Quality over quantity).

I think that the changes are good and that it is better to have more—just as long as Computerworld maintains its reputation for quality. I don't care how the magazine looks really, just as long as it remains the Computerworld that I started to subscribe to, in quality. Keep up the good work.

Robin Radz

I AM READING the Nov. 18 issue of your magazine. While I find it extremely useful in terms of news and commentary, you made a few changes this time.

Most notable is the graphics. Most of the changes are useful. I liked your old style in which different sections had "bookmarks" on the edge of the paper. But I usually read straight through the magazine and don't use the tab markings. What I don't like are the different fonts for the headlines. I find that distracting.

Victims or pirates?

CONCERNING Paul Gillin's Up Front column ["The RBOC whine," CW, Nov. 12] who's whining here?

Gillin sounds like a shareholder of an Internet service provider. It all comes down to hilling the customers for the cost of the service. It is only fair that those who use the system more should pay more.

Your World Wide Web surfing uses the system more (Gillin says five times more; I have heard up to nine times more) than my voice use does. Why should I subsidize your use of the system?

Because consumer voice lines can serve either user, the place to collect the extra charges, proportional to the use of the system, is at the other end of the data connection, the Internet service provider. What Gillin advocates is to spread the cost of the current low percentage of people who use the Internet over the entire population.

Having the Internet grow without subsidies will beat the long-term health of the industry, although it may not pad the pockets of the Internet service providers as much now.

Ron Benson

St. Paul, Minn.

REGARDING Paul Gillin's place on "The RBOC whine," it seems the telephone companies mistakenly believe long hours on the World Wide Web is what we want. Not true!

Crunch
in
NOT people

IS executives can cut costs without layoffs, if they think in terms of processes and activities

by Tony Hope and
Jeremy Hope

rather than
departments and
salaries.

Every IS manager is under pressure to reduce costs. In the IS department, cost reductions tend to fall on people, because people represent the lion's share of cost budgets.

Fewer and fewer analysts, programmers and support personnel are left to cope with the same volume of work. The results are familiar: declining morale, lower quality work and dissatisfied customers, both internal and external.

Part of the problem is that accountants measure costs in terms of salaries, benefits and overhead, rather than in terms of the work people do. We suggest, then by looking at costs through a different lens — the work process — IS managers and their accounting colleagues will be in a much better position to reduce costs without

placing themselves under the constant pressure of staff reductions. If managers cut the workload instead of the workforce, they can lower costs and improve efficiency.

The Cost Budgeting Mentality

Let's start by looking at how the traditional cost-management system works.

Suppose you are the manager of an IS department that serves a range of business units. You are about to submit next year's budget for the system development department. Cash is tight, and you have been told to reduce the coming year's costs by 10%. Your accountant reckons that six jobs will have to go,

but you fail to see how next year's planned work program can be maintained without these people. Last year's expenditures and next year's budget are presented for your approval (see "A Line Item Budget View," above).

Your inclination is to accept the inevitable and cut the six jobs. After all, the only apparent alternatives are to cut salaries and upset all of the staff, or to cut certain discretionary

expenses, which would have only a limited effect.

Before making the final decision, however, you ask a consultant for a different presentation of the department's costs.

In his presentation, the consultant first outlines a "process" view of the department's work (see "IS Process Map," below). He shows the IS capability and its various processes, and he reveals that the processes can be subdivided into "activities." A

Activities	Total Costs	Value Adding	Non-Value Adding
1. Specification	\$400,000	\$400,000	
2. Selecting tool sets	\$200,000	\$200,000	
3. Analysis and programming	\$2.8M	\$1.8M	\$1M
4. Testing	\$1M	\$600,000	\$400,000
5. Documentation	\$300,000	\$300,000	
6. Reporting	\$100,000	\$100,000	
7. Meetings	\$800,000	\$200,000	\$600,000
8. Training/research	\$400,000	\$400,000	
Totals	\$6M	\$4M	\$2M

process, he explains, is a number of sequential work activities with a beginning, an end and clearly identified inputs and outputs. Activities are identifiable and measurable pieces of work that constitute the process.

In the case of "new system development," the consultant breaks the process down into eight activities: specification, selecting tool sets, analysis and programming, testing, documentation, reporting, meetings and training/research. He then presents the revised costs of each of the activities, separating out value-adding and non-value-adding costs (see "A Process View," above).

Naturally, you ask how he came up with these numbers.

First, the consultant says, he had to explain to employees that the purpose of the review was to improve productivity, not to cut jobs. This enabled him to gain the trust and cooperation that is essential if em-

ployees are to provide a log of their non-value-adding time. To do this, each person first must understand which activities add value, so they can tell (by exception) when time is spent on non-value-adding work.

Breaking Down the Workload

The consultant then offers the following example: If the activities of a programmer (let's call her Sally) include programming, reporting and attending meetings, but the fiasco she spends some of her time on other non-related work, or on corrections and reworking, she then knows that such work is non-value-adding and that this time needs to be recorded as such.

This time can then be "corrected" by first applying costs to

each activity, and then extracting the proportion of time and, ultimately, money spent on non-value-adding work.

Here's how it works: Let's say Sally's standard time is set at 80% programming, 10% reporting and 10% meetings, and her total costs, including her salary, travel and share of departmental costs, amount to \$6,000 a month. Sally finds, however, that 40% of her programming time has been spent on non-value-adding activities. We can then calculate this time to be worth \$1,920 a month (\$6,000 x 80% x 40%).

The consultant then returns to his analysis of your processes and costs. The revised analysis, he says, shows that the costs of activities that add value for the customer amount to only two-thirds of last year's total. One-third of the costs were created by work that should not have been necessary in the first place.

A more detailed investigation of the numbers shows that

the analysts, programmers and testing personnel were spending much of their time supporting the needs of departmental users and salespeople throughout the company. This time went unrecorded and unrecognized in the cost budget. User problems were often insignificant, and most could be overcome with more user training.

Moreover, these departmental users had an external support group, but often chose to use in-house analysts and programmers, who were more easily accessible and whose time didn't add to their own departmental costs. Analysts and programmers were also frequently disrupted by salespeople, who wanted help with demonstrations.

All of this may be valuable work, but it is not what these highly skilled technicians are paid to do. Moreover, staff members were frequently called to headquarters for budget review and other senseless meet-

ings, which added further unnecessary costs and detracted from their work.

By eliminating these costs, or at least charging them to the respective departments, a better picture of IS spending emerges. The six threatened jobs can likely be saved.

Budget reviews should be a time for strategic questions, such as "Are we doing the right work?" and "How can it be improved?" Instead, most dissolve into petty negotiations about increases or decreases in accounting costs. What a wasted opportunity!

Deriving the Real Numbers

Studies have repeatedly shown that between 20% and 50% of costs add no value for the cus-

tomers. At one sales division of a major computer manufacturer in Britain, for example, a six-month study showed that 35% of all costs were wasted.

The study found that 76% of deliveries were incorrect, 53% of configurations were wrong the first time, and 45% of orders needed processing more than once. The exercise paid for itself handsomely when the company "recovered" most of these wasted costs within a year or so.

The picture in an IS department is likely to be similar to this company's experience. But how can we derive these types of numbers if the accounting numbers don't help?

The first step is to think in terms of processes and activities rather than departments and salaries.

The process perspective, a centerpiece of the total quality management and re-engineering movements, offers managers

a clearer view of what work should be done, and, when new technology is applied, how such work can be done faster and with greater quality and efficiency.

When a life insurance company spent \$2 million to computerize its processing and claims operations in the early 1980s, it found that it got almost nothing for its expenditure. It still required 27 working days and 32 clerks in three departments to handle a policy conversion.

Only after the company changed how it organized and managed its workforce — relying on semiautonomous process teams of five to seven people, upgrading training and skills, and paying more for the more responsible and more skilled workers — did case-handling time drop and service complaints virtually disappear.

Processers have owners or leaders, and they have customers, either internal or external. Thus, for each activity within the process, we can ask: "Does it add value for the customer?" and "How well is it performed?" If the answer to either of these questions is less than 100%, then excess costs are being incurred.

The language of processes and activities will be familiar to anyone who has an understanding of activity-based costing (ABC), but that's as far as it goes. ABC is typically used as a better method of attributing existing costs to products and customers. Our interest is in eliminating unnecessary costs and thus improving the quality and speed of process work.

By continuously improving processes, we will begin to see

significant productivity gains, particularly from highly qualified specialists.

Management guru Peter Drucker had the right idea in 1963, when he said, "There is surely nothing so useless as doing with great efficiency what should not be done at all."

Some Practical Steps

So what practical steps can we take to weed out this unnecessary and costly work?

We can make considerable progress by undertaking some basic process and activity analysis and then asking a series of searching questions. The 80/20 rule definitely applies: 20% of processes are likely to deliver 80% of the value, and 20% of activities will probably cause 80% of the costs and add little value.

Improving IS Performance

Explain to employees that the purpose is to improve productivity and customer value, not to "spy" on them.

Create process maps and list major identifiable activities.

Question each process for its strategic importance.

Ask of each activity, "Does it add value?"

Repeat the review at least once a year.

Here are five steps to help IS managers improve performance:

Step 1

Sell your program. Explain to employees that the purpose of the exercise is to eliminate unnecessary work, improve the productivity of their work and deliver more value to customers, and thus strengthen their jobs, rather than allowing it to appear as some form of work study that will lead to new bureaucratic controls.

Step 2

Review the IS function and decide on its constituent processes. Include all the people and support costs that comprise the process from beginning to end. Think of each process as a self-contained business (this may involve people not previously thought of as being in the IS department), and make a flow chart with each step of the work, thus arriving at a list of activities.

Step 3

Question each process. Take, for example, "user support" or "system maintenance" and ask if it is essential for meeting the firm's strategic targets. Can the process be done more cheaply and efficiently by outsourcing it?

Step 4

Question those activities that fall within the most strategic processes, then choose those activities with the highest proportion of cost. Ask employees to record their time for a period of, say, three months. Question again the relevance of activities. Are they necessary? What would happen to the performance of the process if they didn't exist? Remember, the fewer the steps in the process, the more efficient it is. Are employees distracted by

The Objective is to eradicate years of clutter from work processes.

helping other people solve their problems (as in the earlier example)? While we are not suggesting they should never help others, you may well find that the real scale of the problem is far greater than you imagined.

Step 5

Implement your proposals, and follow up. Repeat this process every 12 months, until unnecessary work and poor quality is eliminated from the system. The cost savings will be dramatic, and your employees will be happier. Once you have done this, call a meeting of departmental managers and pass the message on.

By adopting this approach, one division of a multinational computer company discovered that its non-value-adding costs

amounted to a staggering 40% of total costs, revealing a savings opportunity that dramatically affected its profitability.

It is important, however, to approach such a review in the right way. The objective is not work study or time-and-motion analysis, but the eradication of years of clutter and debris from work processes, resulting in more satisfied customers and more secure, value-adding jobs.

Significant progress has been made in recent years in the battle against non-value-adding work. For example, in the computer and insurance companies previously mentioned, noticeable changes were seen in managers' and workers' attitudes. They started to think and work as a team, with the common purpose of satisfying customer

needs. The change did not occur through attending seminars or heeding management exhortations, but through trust and understanding reinforced by the new information in hand.

By getting people to work together and sharing information, management at these companies began to cut the workload rather than the workforce, and, thus, make the sort of fundamental changes that would scarcely have been possible with the previous cost-cutting mentality. ♦

COMMENTARY

IBM isn't really 'back'

DAVID MOSCHELLA

IT'S GREAT to see IBM growing and solidly profitable again. So many customers are so dependent upon IBM that when it was losing billions, nerves were rattled well outside of Armonk, N.Y. But beyond the tripling of IBM's stock price, is the media correct in saying that "Big Blue is Back?"

Since he assumed command of the company in 1993, Lou Gerstner's biggest strategic decision has been to restore IBM's traditional role as a customer-centric, united company. He put an end to the idea of IBM as a conglomerate of divisions, such as Pentium, Adstar, ISSC, the PC Co. and so on. Customer confusion and business unit infighting were becoming unacceptable. Gerstner also made it clear that, unlike Microsoft, IBM won't compete with its customers.

At first glance, the results seem to speak for themselves. But IBM's success stems largely from its huge legacy environments. The bold bet on CMOS mainframes is paying off handsomely; the AS/400 line continues to thrive beyond almost everyone's expectations; and IBM's services business, though not as profitable, has grown dramatically.

But problems are mounting in markets that are more open to competition. IBM has stabilized its PC market share, but Compaq remains the clear industry leader. The Lotus and Tivoli acquisitions have gone well, but internal software efforts have produced little. The high-profile PowerPC, OS/2 and micro-electronics initiatives have been major disappointments. Even in the mainframe space, EMC has made such rapid gains in storage that IBM has resorted to selling StorageTek subsystems. Highly focused companies — Intel, Microsoft, Oracle, Citicorp, Compaq, EDS — continue to drive the industry.

Perhaps more troubling, the very core of the hardware and software business is now defined by Intel, Windows, Windows NT, Unix and the relational database. IBM is largely watching from the sidelines. Things aren't much better in the emerging Internet world. Other than its Lotus Domino, IBM has only a minor presence in the World Wide Web hardware and software markets, and IBM lags badly in the booming network equipment business.

In this sense, IBM is becoming what it chose to become: Its integrated, solutions-oriented organization is optimized for enterprise customers services. By contrast, the autonomy and accountability of a divisional structure would produce more competitive product offerings. IBM wants to thrive with both products and services, but that may be impossible.

Where will this lead? An extrapolation of current trends would have IBM continuing to sell products into its legacy

base but increasingly relying on others in most emerging markets.

Strategic acquisitions could strengthen its product portfolio, but IBM's real energy would go toward expanding its global services business.

IBM's goal should be to control the center of electronic commerce services,

with leadership in the Internet market just being a necessary first step. That is a huge and worthy long-term opportunity, with more than enough room for IBM, EDS and others.

If that's the plan, IBM isn't so much "back" as it is repositioned to fight for services industry leadership.

Briefs

DE ships servers

Data General Corp. last week introduced three A-Series servers based on Intel Corp.'s 486-MHz Pentium Pro chip. The A-Series server is a low-cost, entry-level model. Pricing starts at less than \$5,000, and the lower features up to 1GB of memory and 100MB of hard disk.

The dual-processor A-Series server comes with an integrated 640-KB cache and up to 16 GB of memory. Pricing starts at less than \$8,000. The rack-mounted A-Series supports up to two A-Series servers and as many as eight Pentium Pro chips. It costs \$13,000.

Encore's Infinity R/300

Encore Computer Corp. last week introduced the Infinity R/300, which it said will allow heterogeneous clusters to work together.

The Infinity R/300 allows users to configure the machines with a variety of CPUs, I/O buses and operating systems, according to the Port Landville, Pa.-based company. The Infinity R/300 costs \$5,000 to \$6,000 for up to eight nodes.

IBM reveals A/T server

IBM has announced Video-Charger Server for A/T, an A-Series server that delivers audio or video to World Wide Web browsers.

Video-Charger uses Real Time Protocol to stream audio and video data over the network without requiring users to download a separate file and then play it. Video-Charger costs \$10,000 and will be available by March.

High hopes for LCD monitor

• Wyse model offers flexibility, touch screen

By April Jacobs

WYSE TECHNOLOGY, INC. next quarter plans to introduce an LCD monitor that offers features such as touch screens and an infrared window for wireless data transfer.

The WY-9107, which the San Jose, Calif.-based company plans to ship in the first quarter of next year, looks similar to its standard CRT cousins. The difference is it has a flat screen and a modular, turn design, so it can be mounted on a wall or desk in various arrangements.

Company officials said they hope the monitor will take off in environments such as retail, banking, or health care industries. End users in those fields want monitors that are cleaner in appearance and allow for applications where magnetic stripe readers, touch screens, speakers and microphones are useful.

But initial users will have to pay a steeper price for LCD technology than for CRT monitors.

Wyse Technology plans to offer its WY-9107 for \$1,695, several hundred dollars more than users might pay for a

comparable CRT setup.

Don Baune, a service systems analyst at the University of Utah in Salt Lake City, said he is considering buying LCD monitors for the university's teaching hospital in areas where magnetic fields are high, such as where Magnetic Resonance Image (MRI) scans are performed.

The LCD monitors are unaffected by the magnetic fields emitted by the MRI testing equipment and could be used in those areas, Baune said. The Wyse monitors also are spill-proof, which allows them to be cleaned with disinfectants — another benefit in a health care environment.

Baune said he probably won't purchase any LCD monitors until later next year because he would like to see prices drop and screen usage resolution go up. "Right now, lower price is the big issue," he said.

Wyse Technology's WY-9107 monitors feature touch screens

Data General wins storage deal

• Canadian defense department to install Clarion RAID systems

By Matt Hamblen

THE CANADIAN DEPARTMENT of National Defense recently decided to install Data General Corp.'s Clarion storage arrays, citing their competitive cost and ability to attach to both Unix and Windows NT arrays.

The \$1.3 million deal includes 40 Open Clarion RAID Series 2000 systems to be housed in military bases and facilities throughout Canada. Clarion Canada in Mississauga, Ontario, is a business unit of DG in Westboro, Mass.

Canadian officials were bound by law to choose the lowest compliant bid. Twelve bids were made earlier this year, but Clarion was the lowest one that complied in every detail to the requirements of the bid, defense officials said.

The field included Digital Equipment Corp. in Maynard,

Mass., Open Storage Solutions in Toronto, G.E. Capital Services Technology Management Services in Stamford, Conn., Dynatek Automation Systems, Inc. in Bedford, Nova Scotia, Avnet Computer, a division of Avnet, Inc. in Tempe, Ariz., and Sida Systems, Inc. in Austin, Texas.

"Clarion was a better unit and more capable of connecting to different platforms. Flexibility in the connections to other systems mattered," said Mark Scherling, a project leader and senior consultant at the department's Defense Information Network.

EASY ADAPTABILITY

The agency's network now runs on a Compaq Computer Corp. server with a Windows NT 4.0 operating system.

But officials soon may add more servers, and Clarion

Clarion RAID Series 2000
Normal Array
Memory to go

Clarion RAID Series 2000
Normal Array
Memory to go

seemed best able to adapt to that possibility, Scherling said.

The defense department

Windows CE PDAs take center stage at expo

By Mandy Blodgett and Justin Hubbard

SAN MATEO, CALIF.

THE BUZZ AROUND Microsoft Corp.'s operating system for palmtop computers intensified recently as new devices that support Windows CE took center stage at the Hand-Held and PDA Exposition here.

More than 50 companies showcased their hardware and software for the handheld computer market.

Most of their products were based on Windows CE, a stripped-down version of the Windows 95 desktop operating system.

Some potential mobile users at the event, which was held Dec. 4-6, said they were worried by the devices.

"The size is great. I think they will be good for our workers in the field," said Calvin Gray, a field service manager at the San Francisco water department.

PDAs VS. LAPTOPS
Gary Herkman, information systems manager at the Santa Clara, Calif., police department, said his organization is considering buying personal digital assistants (PDA) instead of

laptops, page 53

DE ships servers

Data General Corp. last week introduced three Avion servers based on Intel Corp.'s 300-MHz Pentium Pro chip. The AV1600 tower is a low-cost, entry-level model. Pricing starts at less than \$5,000, and the lower features up to 512M bytes of Error Checking and Correcting memory.

The dual-processor AV2400 comes with an integrated 512K-byte cache and up to 1G byte of memory. Pricing starts at less than \$8,000. The rack-mounted AV3600R supports up to two Avion servers and as many as eight Pentium Pro chips. It costs \$15,300.

Encore's Infinity R/500

Encore Computer Corp. last week introduced the Infinity R/500, which it said will allow heterogeneous clusters to work together.

The Infinity R/500 allows users to configure the machine with a variety of CPUs, I/O buses and operating systems, according to the Fort Lauderdale, Fla.-based company. The Infinity R/500 costs \$15,000 to \$60,000 for up to eight nodes.

IBM unveils A/V server

IBM has announced VideoCharger Server for AIX, an \$25,000 server that delivers audio and video to World Wide Web browsers.

VideoCharger uses Real Time Protocol to stream audio and video data over the network without requiring users to download a separate file and then play it. VideoCharger costs \$28,600 and will be available by March.

High hopes for LCD monitor

• Wyse model offers flexibility, touch screen

By April Jacobs

KASE TECHNOLOGIES INC. next quarter plans to introduce an LCD monitor that offers features such as touch screens and an infrared window for wireless data transfer.

The WY-9107, which the San Jose, Calif.-based company plans to ship in the first quarter of next year, looks similar to its standard CRT cousins. The difference is it has a flat screen and a modular, thin design, so it can be mounted on a wall or desktop in various arrangements.

Company officials said they hope the mounting will take off in environments such as retail, banking or health care industries. End users in those fields want monitors that are cleaner in appearance and allow for applications where magnetic stripe readers, touch screens, speakers and microphones are useful.

But initial users will have to pay a steeper price for LCD technology than for CRT monitors. Wyse Technologies plans to offer its WY-9107 for \$1,695, several hundred dollars more than users might pay for a

comparable CRT setup.

Don Ranne, a senior systems analyst at the University of Utah in Salt Lake City, said he is considering buying LCD monitors for the university's teaching hospital in areas where magnetic fields are high, such as where Magnetic Resonance Image (MRI) scans are performed.

The LCD monitors are manufactured by the magnetic fields emitted by the MRI testing equipment and could be used in those areas, Ranne said. The Wyse monitors also are spill proof, which allows them to be cleaned without difficulty—another benefit in a health care environment.

Ranne said he probably won't purchase any LCD monitors until later next year because he would like to see prices drop and screen image resolution go up. "Right now, lower price is the big issue," he said.

Wyse Technology's WY-9107 LCD monitors feature touch screens.

Data General wins storage deal

• Canadian defense department to install Clarion RAID systems

By Matt Hamblin

THE CANADIAN DEPARTMENT of National Defence recently decided to install Data General Corp.'s Clarion storage arrays, citing their competitive cost and ability to attach to both Unix and Windows NT servers.

The \$13 million deal includes 40 Open Clarion RAID Series 2000 systems to be housed in military bases and facilities throughout Canada. Clarion Canada is in Mississauga, Ontario, is a business unit of DG in Westbrook, Mass.

Canadian officials were bound by law to choose the lowest compliant bid. Twelve bids were made earlier this year, but Clarion was the lowest one that complied in every detail to the requirements of the bid, defense officials said.

The deal included Digital Equipment Corp. in Maynard,

Mass., Open Storage Solutions in Topsham, G.E. Capital Services Technology Management Services in Stamford, Conn., Dynatek Automation Systems, Inc. in Bedford, Nova Scotia, Avnet Computer, a division of Avnet, Inc. in Tempe, Ariz., and Sibus Systems, Inc. in Austin, Texas.

"Clarion was a better unit and more capable of connecting to different platforms. Flexibility in the connections to other systems, whatever," said Mark Scherling, a project leader and senior consultant at the department's Defense Information Network.

EASY ADAPTABILITY

The agency's network now runs on a Compaq Computer Corp. server with a Windows NT 4.0 operating system.

But officials soon may add more servers, and Clarion

Clarion Series 2000

- 1 Number of drives
- 1 Memory storage
- 1 Cache memory
- 1 Height 7.5
- 1 Weight 25

seemed best able to adapt to that possibility, Scherling said.

The defense department

Windows CE PDAs take center stage at expo

By Mandy Hlodgett and Jason Hubbard

SAN MATEO, CALIF.

THE BUZZ AROUND Microsoft Corp.'s operating system's laptop computers intensified recently as new devices that support Windows CE took center stage at the Hand-held and PDA Exposition here.

More than 50 companies showcased their hardware and software for the handheld computer market.

Most of their products were based on Windows CE, a stripped-down version of the Windows 95 desktop operating system.

Some potential mobile users at the event, which was held Dec. 4-6, said they were wary of the devices.

"The size is great. I think they might be good for our workers in the field," said Calvin Gray, a field service manager at the San Francisco water department.

PDAS VS. LAPTOPS

Cary Herdman, information systems manager at the Santa Clara, Calif., police department, said his organization is considering buying personal digital assistants (PDAs) instead of

PDAs, page 53

With all due respect to RISC/UNIX-based systems, we think you'll find the Compaq Professional Workstation offers something that's been sorely missing in proprietary workstations. Namely, freedom.

To begin with, you'll have plenty of power to run your specialized applications. This is made possible through a range of cutting-edge performance features. Including Compaq's advanced system architecture which is optimized for Windows® NT and can run up to two Pentium® Pro processors. And because our workstation is based on open systems standards, you'll find it will integrate easily into your

distributed

existing network. So instead of having to work within the constraints of a proprietary system, you'll have the flexibility to accommodate your needs, whatever they are. Of course, with Distributed Access, you'll also be assured of a transparent connection to all the information you need throughout your enterprise. Even in RISC/UNIX environments.

Another benefit is the result of our partnerships with leading independent software vendors like Microsoft, SDRC, Autodesk and PTC. Because these solutions have been thoroughly tested, you'll get optimum performance and compatibility.

Finally, our workstation provides a lower cost of ownership—not only through price: performance but also through Compaq's industry-leading management features and comprehensive service and support programs. Including hundreds of resellers specially trained for your market.

All said, the Compaq Professional Workstation is unlike any workstation you've ever used before. Which, of course, is exactly the point. For more information on Compaq workstations or Distributed Access, visit us at www.compaq.com or call 1-800-318-7774.

So what's under the hood? 1-2 200MHz Pentium® Pro processors with NT 4.0, a 256K cache, up to 512MB of ECC DIMM memory, an Ultra-Wide SCSI controller, and advanced 2D/3D graphics accelerators.

Has It Changed Your Life Yet?

NEW PRODUCTS

AURA SYSTEMS, INC. has announced Aspects, a line of multimedia speaker systems for desktop computers.

According to the El Segundo, Calif., company, Aspects uses NeoRadial technology to create big woofer bass sound from small drivers. Vibration is reduced with a wooden enclosure.

Pricing runs from \$69.95 per pair for the Aspect 10 model to \$99.95 for each Aspect 40 speaker.

Aura Systems
(310) 643-5300
www.aurasytems.com

SEJIN AMERICA, INC. has announced a

plug-and-play wireless keyboard, **SPR-8695WP**, for Windows 95.

Officials at the Santa Clara, Calif., company said the compact keyboard uses Freeboard technology to allow reliable operation from as far as 20 feet and real-time key response.

The SPR-8695WP costs \$59.

Sejin America
(408) 980-7550
www.sejin.com

DYNAMIC PICTURES, INC. has announced Oxygen 102, a graphics accelerator card for PCs.

According to the Santa Clara, Calif., company, the card delivers three-dimensional graphics. It was designed to accelerate all OpenGL and Heidi-based applications for animation, visualization and computer-aided design.

The Oxygen 102 card costs \$1,495.

Dynamic Pictures
(408) 357-9000
www.dypic.com

KINESIS CORP. has announced a QWERTY DVORAK convertible computer key-board.

The Bothell, Wash., company said the keyboard provides comfort and increased productivity for users. Users can switch between the conventional QWERTY layout and the DVORAK configuration with a simply key combination.

Pricing for the keyboard starts at \$265.

Kinesis
(206) 400-8100
www.kinesis-ergo.com

SHARK MULTIMEDIA, INC. has announced SeeQuest, hardware and software to transform a Windows PC into a desktop videoconferencing workstation.

Officials at the Santa Clara, Calif., company said the kit provides real-time, full-duplex audio and video for a Windows PC.

The kit includes a 33.6K byte/sec. digital simultaneous voice and data modem for use over an ordinary telephone line, a color or black-and-white video camera, Connectix Corp. VideoPhone, microphone and audio/video software.

SeeQuest costs \$479.

Shark Multimedia
(800) 800-5321
www.sharkmm.com

KDS USA has announced two large-screen multimedia monitors for sharp image colors and detail to be used by graphics professionals.

According to the Garden Grove, Calif., company, Visual Sensations VSX-30 and VSX-41 are 20- and 21-in. monitors that are compatible with PCs and Macintoshes. Both automatically adjust the horizontal scanning frequency and have one-year warranty warranties.

The 20-in. monitor costs \$1,299, and the 21-in. model costs \$1,599.

HOT INDUSTRY GIANTS

insist on putting their names

CLARiON storage solutions so hot, our products are single-handedly shaping the upside of the storage solutions space. Up to 60% of our storage products are sold under the names of many well-known open systems enterprise companies, private label resellers and systems integrators. This proves that leaders in the open systems world are proud to put their signatures on the most reliable, scalable and reliable RAID storage product in the world: CLARiON. And CLARiON can prove just as worthy in your organization's Windows NT, Solaris and UNIX systems. CLARiON provides a world class, bullet-proof disk array solution that guarantees extreme integrity and availability of up to terabytes of data throughout the open systems environment. So when top industry giants insist on the value of hot technology and become familiar with CLARiON products, it's not a stretch to think a pretty cool

Advanced Storage Solutions

Specialized servers more prevalent

By James Nicolai

A MOVEMENT is quietly underway in distributed client/server environments to deploy specialized servers, according to a study conducted by the Business Research Group.

Of 250 companies surveyed more than one-third have implemented so-called multitier computing environments, and two-thirds said they will have done so by 1998.

Servers tailored for databases, applications, network services, remote access and the Internet are rapidly becoming the norm, thanks to benefits in perfor-

mance, scalability and manageability, the study found.

WINDOWS NT USE

The Business Research Group, in Newton, Mass., also found that use of Windows NT is becoming more pervasive at the expense of Unix and Novell, Inc.'s NetWare.

Windows NT is used by 28% of the respondents, and 41% said they plan to use it by the end of next year.

Windows NT use is strongest for remote access and applications servers. It is weakest for multifunction servers, where NetWare still reigns, according

to the Business Research Group's findings.

Unix vendors have to overcome issues of market fragmentation, complexity of use and high cost if they are to continue to compete, according to the study.

The study also indicates that the network computer — touted by the likes of Oracle Corp and Sun Microsystems, Inc. — may have a role in terminal replacement due to its relatively low cost of ownership and management.

Nicolai writes for the IDC News Service in Boston.

Windows CE PDAs take center stage

CONTINUED FROM PAGE 43

playing laptop computers in the field.

"With these handhelds, the officers could not carry them to crime scenes and send in reports without having to lug around notebooks," Herkman said.

HOLDING OFF

Other users said they are taking a wait-and-see attitude toward the devices.

"I think it might be better to wait four or five months down the road to see what happens to the hardware," said Dale Reed, a PDA/mobile specialist at Chevron Information Technology Co., a division of Chevron USA, Inc. in San Ramon, Calif.

"I'm trying to keep the users from running out and buying things that may not have the functionality they need," Reed said.

VENDOR SUPPORT

Several companies recently announced products that support the Windows CE system. Those vendors include the following:

- Digital Equipment Corp. in Maynard, Mass., said Microsoft would make sure Windows CE supports Digital's Strong Arm RISC microprocessor in handheld computers and smart phones.

- Microsoft said it would support Motorola's, Inc. family of PowerPC MPC RISC microprocessors for portable devices, including PDAs.

- Spyrglass, Inc. in Naperville, Ill., announced several software products aimed at providing better connectivity to the Internet for PDAs and handheld computers, including Remote Mosaic (see chart, page 45).

Ron Rappaport, an analyst at Zoss Research, Inc. in Redwood City, Calif., said users now want Internet connectivity on all devices, including PDAs.

They want "to have information wherever and whenever possible," Rappaport said.

Data General wins storage deal

CONTINUED FROM PAGE 43

needed to maintain instant availability of online information and ensure data integrity so that each of the Canadian locations could work independently if connections among sites were lost. Other vendors offered such opportunities but at higher cost, officials said.

The department is also in the process of reducing the workforce at its headquarters by 7,000 by 1999 and reducing the amount of paper used each year.

CUTTING PAPER COSTS

Within the defense department headquarters, there are an estimated three filing cabinets per person, and even a 5% dent in the cost of processing paper will have paid for the Clarison system, officials said.

Anders Lofgren, an analyst at Giga Information Group in Cambridge, Mass., said he was surprised that open storage systems vendor EMC Corp. in Hopkinton, Mass., wasn't among the bidders, considering its growth in the market. But he said it is hard to judge how vendors

set the price of their bids in the Canadian contract.

Analysts at International Data Corp. (IDC) in Framingham, Mass., list Clarison as the leading OEM supplier in the Unix RAID market. It had 1996 revenue of \$329 million, which is 51% of the worldwide market.

MULTIPLE CONNECTIONS

Robert Gray, research manager for storage subsystems at IDC, said even though the Canadians were required to pick the known bidder, it is a plus that the Clarison products can be connected with multiple servers. "Clarison is one of the few that can do so," he said.

Clarison offers a range of disk array storage products. Its entry-level Model 150 system was designed to support PC LANs. Series 2000 systems, in use in the Canadian defense department project, were designed for midrange open systems users. The high end of Clarison's disk array family, the recently unveiled Series 3000, provides up to 3T bytes of storage.

SHORTS

Processor shipments

Shipments of microprocessors this year are 20% higher than last year, and next year's shipments are expected to grow by 18%, according to a market study by Forward Concepts Co. in Tempe, Ariz., and Micrologic Research in Phoenix.

Strong PC sales contributed to this year's microprocessor sales, which are expected to finish the year at \$7.1 billion, up from \$5.4 billion last year. The 1997 forecast is based on demand prompted partly by the expected release of Intel Corp.'s new multimedia Pentium processor. Continuing upgrades to Windows 95 by companies

will also fuel demand, according to the report.

TCP/IP for AS/400

Perla Systems, Inc. in Toronto this week will update its AS/400 controller with support for TCP/IP. The 494E controller acts as an SNA-to-TCP/IP gateway on AS/400 shops can eliminate SNA networking issues from the wide-area network while retaining SNA devices such as 3270 terminals or SNA network printers. Current AS/400 users can download the TCP/IP options free of charge from www.perla.com, but they will have to buy more memory to handle processing requirements.

TODAY YOUR NETWORK IS A TARGET.

INTRODUCING BULLETPROOF SECURITY.

Only McAfee Security Suites provide complete protection.

To protect your network these days, you have to protect each *part* of the network—the perimeter, servers, desktops, even network traffic. That's because today's intruders can infect, penetrate, eavesdrop and sabotage nearly any element on your network.

Most computer security breaches are committed by employees.
—1996 FBI Computer Crime Survey

Even your employees are a danger. In fact, according to the 1996 FBI Computer Crime Survey, most network security breaches are committed by the very people who walk past your firewall every day.

Guards against all network threats. Both outside and inside.

McAfee's unique new security suites provide all the tools you need to fully defend your network. Everything from perimeter and desktop firewalls to anti-virus and encryption.

PC Firewall® protects desktops against unauthorized access by outsiders and employees. It also denies unauthorized connections to the Internet, thus preventing back-door access to your network.

SecureDesktop combines the industry's best selling and most effective anti-virus software with two types of industrial-strength encryption. One transparently encrypts all traffic across TCP/IP networks. The other secures files, e-mail and attachments, even if the receiver doesn't have the same encryption software.

SecureGateway integrates network anti-virus with a perimeter firewall for maximum network-wide protection. Based on McAfee's

#1-rated detection engine, the anti-virus automatically scans e-mail, FTP and HTTP file transfers and traps viruses before they can infect the network. And the perimeter firewall bars hackers from gaining access and filters out unwanted Internet activity.

To order or to receive the free McAfee Security CD with actual working software, call 1-800-332-9966 today. We've got you completely covered.

McAfee Security Suites protect every part of your network
—perimeter, servers, desktops, even network traffic

Middleware pulled

While rivals such as Informix Software, Inc. and Oracle Corp. are developing object-oriented database management systems, IBM is not. Instead, plans to rely on middleware to back its SQL Server database to objects stored in spreadsheets, image management systems and other applications. That capability will be provided through OUT DB, a Microsoft-designed data-store interface that the company said will be built in to the next version of SQL Server, scheduled to ship in the second half of next year, said officials at the Redwood, Wash., company.

Numbers on some ship

Recent geographic information system (GIS) vendor mergers have led to the same question: How many users? The vendors—Intergraph Software Solutions, Inc., Informix Software, Inc., and Bentley Systems, Inc.—all say they will support some of the platforms mentioned in the mergers.

Specifically, the vendors will confirm that Windows platforms sought by the Open GIS Consortium, Inc. (OGCI). The OGCI is an organization of vendors attempting to establish open standards for the GIS industry. The vendors said they will support various interoperability issues, the results of which could be the basis for a new standard for GIS. The vendors also said they will support various interoperability issues, the results of which could be the basis for a new standard for GIS.

Claims off-kilter

► DataBlade users unfazed by Oracle salvo

By Craig Stedman

A CAMPAIGN THAT Oracle Corp. is waging to sow doubts about the safety of Informix Software, Inc.'s DataBlade plug-in doesn't seem to have scared many users who are looking closely at Informix's new Universal Server database.

Oracle has worked mightily for the past month to discredit the DataBlade approach as a potential cause of database crashes. DataBlades are add-in modules that link directly to a database, allowing Universal Server to support objects and nonrelational data such as

video, audio and text.

Safety is a valid concern, especially when third-party plug-ins are involved, said some prospective users after this month's announcement of Universal Server ICW, Dec. 9. The object-relational hybrid is due to ship by year's end; Oracle's object-enabled Oracle6 database isn't expected until next summer.

But several users with DataBlade experience described Oracle's claims as overblown, provided that an Informix certification program for third-party DataBlades weeds out bad code as promised. They said that

OracleBlade, page 57

Easing group projects

► Team Manager can help manage workgroups

By Jeffrey Gordon Angus

THE SINGLE MOST valuable computing task you can do on a network is to manage and track workgroup projects. Microsoft Corp. next year

PRODUCT REVIEW

will introduce a program designed to help people who are working together on projects to coordinate, consolidate and track the team's activities.

Team Manager 97 integrates tightly with Microsoft's Office 97 suite, Outlook, and is a positive first effort for the company.

Outlook is Microsoft's replacement for Exchange and Schedule+. It is a console for managing mail, personal and workgroup information, documents and light projects.

The only offering that might be parallel to Team Manager is Manage Pro 1.2 from Emeryville, Calif.-based Avanzon Performance Systems, Inc. The late

beta of this first version of Team Manager 97 is less evolved than Manage Pro but may have advantages for specific users. Users who are looking for such a tool need to consider both offerings.

Both products require that the whole team is committed to using them, but Manage Pro brings with it an entire management philosophy and a set of

Team Manager offers project leaders access to various types of updates—such as project costs—at the click of a tab

mutually reinforcing methods to drive the success of the organization. Team Manager succeeds just as well at the task management and individual progress tracking level but

Team Manager, page 57

DATABASES

Sybase goes for decision support

By Craig Stedman

DATABASES DESIGNED expressly for decision support can keep end users from twiddling their thumbs while running queries. But they also make information systems managers jump through different hoops from what they are used to with regular relational databases.

"It's a different animal, so we have to kind of go back to the drawing board and rearchitect things," said Chris Lange, data

warehouse architect at National Semiconductor Corp. in Santa Clara, Calif. The chip maker is testing Sybase, Inc.'s Sybase IQ database and expects to shift its data mining to the decision-support software next spring.

For user-written queries that can take unpredictable twists and turns, a decision-support database should deliver big speed boosts over relational software, according to Lange and several other IS managers. But it, may require different approaches to configuring, loading and backing up data, they said.

EXPANDED CAPABILITIES

Sybase in Emeryville, Calif., introduced Sybase IQ last March and announced an updated version on Dec. 3 with faster performance, expanded platform support and parallel file-loading

Decision support, page 58

PC makers feel Windows 95 pinch

By Laura DiDie and April Jacobs

PC MAKERS ARE under pressure from Microsoft Corp. to preinstall Windows 95 and ensure that their systems host to its main window before anything else.

Although large corporate users are generally unfazed, some small and medium-size businesses are feeling the pinch. This isn't an isolated incident.

Just last week, hardware OEMs—led by IBM and Netscape Communications Corp.—publicly charged that Microsoft's new is seeking to enforce a clause in their licensing agreements that would require the PC makers to boot the Windows operating system before anything else [CW, Dec. 9]. The implication, the rival vendors said, is that Microsoft gains an advantage by

Windows 95, page 64

DataBlade users unfazed

CONTINUED FROM PAGE 55

companies haven't run into problems with DataBlades that were written for the object-enabled Illustra database. Informis bought Illustra in February and is merging the product with its relational engine to create Universal Server.

"I don't think there's a big risk," said Michelle Kilduane, director of fixed-income trading technology at C3 First Boston Corp. in New York. The investment firm built an Illustra-based financial research library last spring. The library uses a World Wide Web DataBlade owned by Informis and a test-search module that was written by a third party vendor and is sold by Informis. The company plans to migrate to Universal Server in January, Kilduane said.

USERS SAY IT'S SAFE

Concerns about the safety of new technologies "is almost a knee-jerk reaction. But I've found [DataBlades] to be perfectly safe," said Harry Mendell, a vice president in the market risk unit at Morgan Stanley & Co. in New York.

Morgan Stanley is prototyping a time-based analysis application that uses the Illustra database and both Informis supplied and internally developed DataBlades. The company isn't treating the DataBlades differently from other software, Mendell said. "There's nothing that's crash-proof," he said.

Concerns about the safety of new technologies "is almost a knee-jerk reaction. But I've found [DataBlades] to be perfectly safe."

— Harry Mendell, Morgan Stanley

Oracle executives have contended in speeches, interviews and white papers that plugging add-in modules directly in to a database could bring down the whole thing if faulty code isn't detected. Informis's testing of third-party DataBlades could get unwieldy as more and more

vendors start to write modules, Oracle officials claim.

But Malcolm Colton, director of database marketing at Informis, said DataBlades will be tested "far more than the average 15 department does with its applications." Even if a faulty DataBlade did get through, it would pose a risk to only a single thread in the database, he said.

Sabre Decision Technologies, the software development unit of AMR Corp. in Fort Worth, Texas, is beta-testing Universal Server for potential use in an upcoming object-enabled data warehouse.

Because of DataBlades and its support for objects, Universal Server "will be tougher to maintain than a standard relational database," said Brad Jensen, a vice president at Sabre. "But there's no free lunch, and we don't have too many other choices now."

"I guess if I was in Oracle's shoes, and I didn't have a competitive product, I'd probably say the same thing they are," said Alfred Watkins, a senior technical staff member at AT&T Laboratories in Holmdel, N.J. AT&T is looking at developing Internet-based multimedia applications using multiple databases for external customers.

Team Manager eases group projects

CONTINUED FROM PAGE 55

doesn't exist as far as Manage Pro, for example, has a content-sensitive management coach built in: at each screen, a user can get product help and skills reinforcement.

Microsoft officials say they have designed Team Manager for a different kind of manager than they would expect to use a project management product, such as Microsoft's Project or Project Scheduler from Sotter Corp. in Menlo Park, Calif. Team Manager is meant for functional managers who chronically juggle a mix of projects that carry specific deadlines and ongoing activities that have no due dates. It is for managers who are interested in meeting deadlines and maintaining priorities to a task.

EXCHANGING MESSAGES

Team Manager uses an electronic mail system or shared network folder to help users exchange proposed task assignments, status reports and notes. The person who acts as the group's manager outlines the tasks and components of each project and sends the assignment to a staff member. If the staff member accepts the task, it goes into his task list.

Alternatively, the staff member can send the task back for negotiation. But once a staff member has accepted, he is responsible for maintaining progress reports on his tasks. These progress reports are sent to the manager who clicks a button to incorporate them into the main status database.

There are several levels in Team Manager that I love. It effectively uses

group psychology by publicly showing which status reports were delivered on time and which were late, thus creating peer pressure to keep the group informed. Microsoft understands the most productive way to work in groups is with less hierarchy and more collaboration.

PICKY, PICKY

And, unlike traditional project management programs, the predesigned reports in Team Manager support the nitty-gritty detail management most staff managers now have to execute in "domesticated" organizations. Team Manager's reports help leaders make task usage decisions by clearly presenting which tasks are off-schedule and which have priority.

The product allows you to top up staff information from E-mail directories, which saves time and reduces re-entry errors. It also can be customized to include your choices for views and your preferences for naming methods. I also like the way the product dovetails with the personal task management intrinsic

to Outlook.

On the other hand, Task Manager lacks the evolved management perspective found in Manage Pro. Manage Pro was designed by professional managers, and it features management advice at every turn. Manage Pro's customization includes templates for many kinds of industries and endeavors.

Manage Pro's interface isn't perfect but has been polished with time. Microsoft's interface has some kinks that should get straightened out over time. For example, Team Manager uses colored, underlined text for each staff member, and it looks exactly like a hypertext link in an Internet search engine. It doesn't jump to anything if you click on it. It just makes it easier to read. This could confuse users who have become accustomed to World Wide Web highlighting.

DESIGN ELEMENTS

Team Manager includes some good design, too. For example, instead of having to type in start and end dates, you can use the mouse to drag a precise selection from a visual calendar, which is quicker and helps you account for days of the week. The interface snags are minor, and most users will find them only irritations until they learn the product.

There is a lot to like in this first version of Team Manager. Even if you aren't going to implement Office 97, it's a worthwhile product for managers who are networked to their workgroup. But if you want to see how far and how fast your workgroup can go, take a close look at Manage Pro, too.

Angus is a project director at The Data Works Ltd. in Seattle.

NEW PRODUCTS

SMARTPATENTS, INC. has announced SmartPatent Workbench 4.1, an analytical software tool to help companies electronically search, organize and analyze patents.

According to the Mountain View, Calif., company, Workbench 4.1 will let users analyze their own patents and com-

petitors' patents to gain a business advantage.

Workbench 4.1 is free, but SmartPatents sells a patent database. Pricing starts at \$7 per patent.

SmartPatents
(415) 837-0900
www.smartpatents.com

THURSBY SOFTWARE SYSTEMS, INC. has announced Dave for the Macintosh, software to share files and printers with Windows 95 and Windows NT networks that use TCP/IP.

According to the Dallas company, Dave is for users who want to use only TCP/IP as a network protocol. With Dave, users can access networks as if they were on a local Macintosh.

Pricing starts at \$179.

Thursby Software Systems
(817) 478-5070
www.thursby.com

SOFTTEK, INC. has announced W.Fax, intranet fax server software.

According to the Trabuco Canyon, Calif., firm, W.Fax lets users point, click and fax directly from a Netscape Communications Corp. Navigator browser. Pricing starts at \$5,500.

SoftTek
(714) 888-1181
www.softek.com

CE SOFTWARE, INC. has announced QuickMail Pro 1.0, cross-platform Internet electronic-mail software for Windows 95 and Apple Computer, Inc.'s Mac OS.

According to the West Des Moines, Iowa, company, QuickMail provides automatic attachment encoding, background mail processing and Message Peek, which lets users view the first few lines of a message before they open it. Pricing starts at \$69.95.

CE Software
(515) 221-1801
www.cesoft.com

TEXAS INSTRUMENTS, INC. has announced the Livegear Personal Organizer/Module Pack, software and hardware for synchronizing TI's Personal Organizer and TravelMate 6000 series notebook.

According to the Dallas company, the product lets users carry essential personal information from their TravelMate GoGo with them in a pocket-size Personal Organizer. When users get back to the office, they can slip the product into the module, which fits into the notebook's media bay for synchronization of data in the organizer with data in the notebook.

The Livegear Personal Organizer/Module Pack costs \$230. The Windows-based software alone is \$100.

Texas Instruments
(800) 842-4737
www.ti.com

ENTERPRISE RESEARCH, INC. has released ERI/CICS 3.1, an upgrade to its suite of integrated CICS management tools.

According to the Research Triangle Park, N.C., firm, it includes a single sign-on option for CICS and an application profile editor.

Pricing starts at \$18,000.

APPLICATION DEVELOPMENT

Hark the herald users sing

FRANK HAYES

THE HOLIDAYS are the perfect time to reflect on the true meaning of... well, of corporate application development.

Go to any shopping mall in the past few days of the holiday shopping season, and watch the inmates take over the asylum.

The shoppers ran in every direction, bouncing from one store to another. They can't find what they want, so they make on-the-fly, seemingly nonsensical substitutions. And tempers flare as time grows short and lines get longer at the cash registers.

What's this got to do with software development? This madhouse is the way business is really done y65/day a year. It's the chaos faced by your users whenever they deal with your company's customers.

No wonder users and software developers always seem to be at each other's throats. Programmers try to work strategically, building the most efficient systems for performing business transactions in a logical, straightforward way.

But users—especially when they're dealing with customers—have to be tactical to the extreme in a world where there is no sanity clause.

When customers change their minds or want something unusual, there's no carefully designed set of project requirements to update. It's find a way—and right now—or lose the sale.

USER DEMANDS

That's why salespeople and customer-service representatives end up doing unreasonable, ad hoc things that your systems weren't designed for.

They want information in the wrong order. They want unusual combinations of data. They want to back out of completed transactions when a customer makes a new demand. And that wreaks havoc on the nice, orderly systems that programmers like to build. A program designed to work most efficiently—or even just sensibly—won't necessarily map well to the way users will be required to use it.

Of course, knowing you work in a logical world and that your users are neck-

deep in chaos doesn't make them easier to deal with. They still add requirements constantly, demand changes and want software yesterday and updates today.

But maybe now would be a good time to think about getting to know your users better—and not just at requirements meetings or holiday office parties.

Pay closer attention to how users deal with customers. Watch users at work, as customers make them back up, change entries or copy information off the screen onto a memo pad.

What users do and why they do it will become increasingly important to you in the next year or so.

Right now, users are the cushion between those customers and the applications you build. If your software has rough spots or is missing functionality, users perform whatever work-arounds they must to send the customer away with a lighter wallet.

But soon you'll be called upon to make your systems available on the Internet. When that happens, there won't be any friendly human sales clerk to smooth over problems in your applications.

You think your users are a pain to deal with today?

Just wait until you're dealing directly with that cantankerous crowd of customers who at this very moment are fighting with elbow-in-your-eye abandon for the last Nintendo 64 in the store.

Hayes is Computerworld's staff columnist.

Sybase IQ

CONTINUED FROM PAGE 58

capabilities. It is trodding a path first blazed by Red Brick Systems, Inc., a Los Gatos, Calif., vendor that has been shipping a data warehouse database since 1994.

The decision-support databases are collections of simple indexes that link files together for querying and nothing else. Sybase IQ and Red Brick would be hopeless at running transactions, but they can zip through queries for which regular databases "would make you sit there until your beard turned gray waiting for an answer," said Stan Dolberg, an analyst at Forrester Research, Inc. in Cambridge, Mass.

For example, Lange said a query that National Semiconductor ran against its booking, billing and backlog data took more than 90 minutes on a Sybase SQL Server database. The same query took just 70 seconds on Sybase IQ, he said. Typically, Sybase IQ can test queries in about one-tenth the time that SQL Server needed.

But with Sybase IQ, National Semiconductor can no longer spread data across multiple interconnected databases for easier loading and backup, Lange said. "You can't do that with IQ. You have to put everything in a single database," he

said. Lange said he also has hit a few bumps, such as limits on the size of numbers that Sybase IQ can handle.

SmithKline Beecham Corp. now separates its querying data across several SQL Server installations for safety's sake. "If one database goes bad, the other two would still be avail-

PHOTOGRAPH BY [illegible]

"We can't index our traditional relational database to anticipate the different angles people [will] go in."

—Chris Lange,
National Semiconductor

able," said Rob Swift, database manager at the Philadelphia-based pharmaceuticals manufacturer.

Sybase IQ won't offer that protection, but SmithKline Beecham expects to get 40% to 50% better performance by

switching to it, Swift added. Tuning SQL Server to run specific queries faster would be fruitless, he said. "We have no clue what users are going to ask. They're just looking for any patterns they can find in the data," Swift said.

For now, use of decision-support databases remains limited: Red Brick has 150 users, and Sybase said it has shipped Sybase IQ to 155 customers—a drop in the bucket of its installed base.

"It's not an easy sell because most IS people don't want to bring in something that's alien to the databases they know," said Wayne Eckerson, an analyst at Patricia Seybold Group in Boston.

ALVISA Tunnel

INSIGHT

Successfully Migrating

Corporate America is fast embracing Windows NT workstation for its desktop computing as it seeks a true multitasking, robust, 32-bit OS with reliability, security, and high performance. The Pentium Pro, offering superior speed and performance, is far and away the preferred platform for NT. These were among the key findings of IDC's recent global survey of 1,500 corporate enthusiastic NT adopters and active evaluators.

International Data Corporation (IDC), the world's leading information technology (IT) research firm, recently surveyed 1,500 medium-sized and large corporations around the world about their advanced desktop PC usage and plans via in-depth telephone interviews. Primarily, the research analyzed how corporations are currently using and adopting advanced Windows NT/Pentium Pro systems and what users found as key drivers and constraints. The study focused on advanced adoption so that organizations adopting less than 10% NT systems among their total systems, within the next two years, were excluded from the survey.

The market momentum for NT/Pentium Pro systems will intensify over the next 3-18 months, especially among U.S. corporations. Key drivers for this upward migration include the accelerated price/performance improvements of the Pentium Pro; the increasing availability of 32-bit applications; and recent release and success of Windows NT Workstation 4.0. IDC predicts 1998 to be the pivotal cross-over year when U.S. Pentium Pro Processor PC U.S. sales will exceed Pentium Processor PCs overall, and when NT will surpass Windows 95 on desktops in large corporations.

Key Advanced PC Study Findings

- By YE 1997, half said at least 50% of new PC purchases will be Pentium Pros.
- Corporate user plans by late 1997 include the following:
 - 150% increase in Windows NT
 - 50% decrease in Windows 3.X
 - 50% increase in Windows 95
- Within two years, the majority of internal application development will be 32-bit.
- Reliability, security, and performance are top reasons for choosing NT over Windows 95.
- Twenty-five percent of respondents will gradually roll out NT company-wide; 50% will roll out NT selectively.
- Key NT applications are general office, software development, technical/engineering, customized business, and multimedia.
- Performance and speed are top benefits of running NT on Pentium Pro PCs.
- Cost, hardware requirements, and incompatibility with existing software/peripherals key barriers to adoption.

Why Upgrade to Advanced PCs?

Corporate PC users are constantly seeking better CPU performance, more memory, faster data access times, and more powerful OS and application suites. In the late 1990s, technology continues to accelerate with more intensive requirements due to the increase in the size of applications and graphics-intensive files; expanded multimedia data types (color images, audio, and full-motion video); the inclusion of more software (Web browsers, utilities); and the constant IT mandates to cut costs and improve productivity. In addition, the tremendous growth in the Internet, Web, and corporate intranets is bringing ever-greater amounts of data to the desktop.

Recent and unprecedented price/performance improvements in advanced PC systems have whetted organizations' appetites. IDC PC pricing research indicates the cost of Pentium Pro systems will decline a full one-third to nearly half (for 33-47%) from the beginning to the end of 1996, depending on chip speed. As an industry example, consider the advanced desktop offerings in late 1994 vs. late 1996 from AST Computer. AST's high-end brand series has dropped in price by more than one-third, from about \$4,300 to about \$2,850 in estimated street price, while the overall performance offering has more than doubled. In short, there has never been a time in which corporations have needed advanced desktop PCs more, nor a time in which cost justification for upgrading has been stronger for the business enterprise.

Pentium Pro—Platform for and to the Future

The Pentium Pro, Intel's sixth generation microprocessor family, released in late 1995, was specifically designed to optimize the performance of 32-bit code while maintaining backward compatibility with previous x86 code. In essence, the chip is a bridge between today's world, which predominantly uses 16-bit OS (Windows 3.X) and applications, and the emerging world of 32-bit OS (NT, Windows 95) and applications, which is fast becoming the industry desktop standard. The Pentium Pro also offers unparalleled speed and performance through its superscalar and superpipeline design; Intel's "Dynamic Execution," and its L2 "cache on-board" dual-chip module.

As prices further decline, IDC predicts that demand for Pentium Pro PCs will increase significantly, especially in the corporate environment. Current street prices for NT/Pentium Pro systems have now fallen to less than \$3,000—within the range of most corporate IT budgets. Accelerating price competition and expanded product selection will continue through 1997, which will further fuel the market. IDC anticipates Pentium shipments will peak in 1996, and the Pro, with 15 million units, will surpass Pentium sales (13.9 million units) as the dominant PC platform in the total U.S. market by 1998 (see Figure 1).

The Corporate Move to Windows NT

Migration to the 32-bit desktop enables true multitasking, improved reliability, virtual memory, multiprocessing, and robustness. More than half (53%) of those IDC surveyed currently do 32-bit application development. Key drivers of 32-bit adoption cited by the IDC user base included new application availability; price declines; performance gains, and the success of NT

Sponsored by

AST
COMPUTER

to Next Generation PCs

Figure 1 - Pentium vs. Pentium Pro Processor Ships

4.0. Within two years, three-quarters of all internal PC application development will be 32-bit.

Again, IDC user research bears out corporate America's preference of Windows NT over Windows 95 or any other OS. Corporate users surveyed included in their 12-month plans a 150% increase in the use of Windows NT. They saw a decrease of Windows 3.X or Windows for Workgroups use by about 50% and an increase of Windows 95 by only 50%. Users cited reliability, security, performance, and robustness, in that order, as the most important reasons for choosing Windows NT over Windows 95. The primary departments driving advanced desktop computer system purchases among IDC respondents are MIS/IDR, engineering, and R&D-traditional leading technologies, as might be expected. Somewhat surprising, are the current applications users identified running under NT such as general office automation packages (word processing, e-mail, spreadsheets) or today's general mainstream desktop applications (see Figure 2).

Among corporations polled, the Pentium Pro was also the preferred platform to run NT. Fifty percent of respondents stated that at least half of all their new PC purchases will be Pentium Pro systems by the end of 1997.

The Call to Action

The decision of when and how to upgrade an IT infrastructure is difficult and complex. Hesitating can be even more hazardous, possibly leading to forfeited opportunity costs and lost productivity. As we approach 1997, it is clear that the U.S. corporate migration process to NT/Pentium Pro PCs is far beyond initial assessments.

Perhaps the only thing as important as choosing the right advanced PC is choosing the right vendor partner behind it. The top criterion among the survey respondents were price/value and technical support. IDC recommends users to look for PC vendors that push the price performance

ratio and offer the most complete total value package. Closely examine what prospective vendors include in:

- Hardware (components, configurations, investment protection);
- Cost of ownership (virus protection, data and system management, real time diagnostics);
- Productivity enhancement (Internet/intranet, utilities);
- Vendor viability;
- Product quality and price/performance.

IDC predicts that 1998 will be the pivotal cross-over year when Pentium Pro outstrips Pentium U.S. sales overall, and NT surpasses Windows 95 on desktops within large corporations.

Given its total value, performance benefits, and headroom, the time for serious consideration of NT is here. The collective experience and insights of 1,500 corporate users—senior IT managers already in upward PC migration, can greatly benefit an organization's information technology design and planning.

Figure 2 - General PC Applications Running Under NT

This insight was written independently by IDC and sponsored by AST Computer. The Boss.

If you're very lucky, there will be a few moments in your career when the people who really matter think you're an absolute genius. And if you're about to upgrade to computers with Pentium® Pro processors and convert your company to Windows NT®, the next such moment could be arriving sooner than you expected. That is, if you make the extraordinarily brilliant, wunderkind-like decision to choose the AST® Bravo MS-T Pro.

The power everyone wants.

The Bravo MS-T Pro comes with amazing technology like the Matrox Millennium graphics card. And with the Pentium® Pro processor, it's a breeze to run popular business programs—in 16 or 32 bit format—up to 64% faster than you run them now. To enhance productivity even more, there's AST IntraAccess™ complete Intranet/Internet software.

Amazing technology. Amazingly affordable.

\$1,999*. (Sorry if we shocked you.) That's close to a thousand dollars less than many comparable competitive models. Which means you can have exactly what you want, and a lot more of it than you thought. Business should be this easy.

Don't expect the usual service. Expect more.

To prove how eager we are to keep you happy, AST ExpressService™ provides the fastest, most flexible service around. We'll usually answer your call in a minute or less. And if you need parts, we can deliver them in a day. For a reseller near you call us at 800-876-4AST or visit www.ast.com. We'd be happy to answer your questions about the AST Bravo MS-T Pro. And more than happy to welcome you aboard.

*Estimated selling price, monitor not included. Actual prices may vary. Contact reseller for details. ©1996 AST Research, Inc. AST is a registered trademark. Windows 95 pinch

CONTINUED FROM PAGE 55

controlling the desktop boot process in the burgeoning Internet and intranet markets.

Users and especially PC hardware vendors typically don't like to be explicit or vocal in criticizing Microsoft, mostly for fear of reprisal because Microsoft com-

mands a whopping 85% of the desktop operating system market. Privately, though, officials at some OEMs said they are working furiously behind the scenes to hammer out mutually beneficial licensing pacts that don't force them to always preload Windows 95.

When it comes to preloading Windows 95, several Fortune 500 shops interviewed by Computerworld said they are charting their own migration courses

"No way will we migrate our desktops one minute before we're ready," said Gary Wilkerson, program and external services administrator at Kaiser Foundation Health Plan, Inc. in Atlanta. Wilkerson said the firm's 90,000 users companywide gives it a good deal of leverage when dealing with Microsoft.

Dan Schuffert, senior systems programmer at a large Midwestern paper manufacturer, agreed. His company,

which has about 40,000 users, has been gradually converting to Windows 95 since the summer. About 15% of his users now are on Windows 95; the rest will be upgraded in the next several months.

"We've never gotten any nudging from either our hardware OEMs or Microsoft to upgrade," Schuffert said.

But although large corporate accounts are insulated from the pressure tactics, midsize and smaller businesses have no such immunity.

An IS manager at a southern manufacturing firm, who requested anonymity, said he was the victim of strong-arm tactics. "My Microsoft sales rep told us in no uncertain terms that if we waited to migrate to Windows 95 that our licensing discount would essentially disappear," the manager said. "There was some room for negotiation — we did still until this January. But with companies our size, they know they've got us over a barrel."

OPERATING SYSTEMS

PC manufacturers said they will continue to offer both the legacy Windows 3.x and Windows For Workgroups software along with Windows 95 as long as users request them. These days, though, most systems come preloaded with Windows 95, and few customers are asking for the legacy operating systems.

Bill Collins, a spokesman for Dell Computer Corp. in Austin, Texas, said there is no direction from Microsoft as to whether Dell should load any particular operating systems within the Windows family. But he declined to discuss specific licensing arrangements the company has to preload Windows 95.

MUM'S THE WORD

The world's No. 1 PC maker, Compaq Computer Corp., will discuss neither its agreements with Microsoft regarding the Windows operating systems nor if it has any preferences when it comes to what it offers its customers. Carl Gulledge, director of marketing for Compaq's OEM sales, said his company encourages OEMs to let users take advantage of what a PC has to offer in a 32-bit environment. That rules out Windows 3.1.

"We are working with our OEMs to find ways to get the value of what they've engineered in their machines, and the best way to do that is with Windows 95," Gulledge said.

What Compaq hasn't done is make pricing an incentive to migrate. It costs more to license a copy of Windows 95 than Windows 3.1, and that won't change any time soon, Gulledge said.

Not that pricing has appeared to matter much. Gulledge said that one year ago, when Windows 95 was introduced, only about 1% of machines leaving OEMs preloaded were for 32-bit environments. In a little more than a year, that percentage has risen to nearly 90%, he said.

For its part, a spokesman for Microsoft said that although Windows 95 is the company's premier operating system, Microsoft continues to let OEMs choose any of the operating systems in the Windows family when preloading desktops.

Where should your enterprise
communications strategy begin:

or Earth?

*By knowing networks from the ground up,
3Com is delivering solutions for the real world.*

Precious few companies have mastered advanced computer networking. And of those, only one began where the rubber, as they say, meets the road: at the user level. In fact, 3Com has networked more than 42 million users around the world.

Knowing how networks work at every level compels 3Com to deliver more than the big switches and routers used to run Fortune 500 global systems. 3Com network solutions deliver

the consistent application response time critical to businesses of today like banks, healthcare providers and, not surprisingly, other major technology companies. If, like these companies, you consider networks

to be vital — not optional — to your business, contact 3Com.

With a stellar reputation* for reliability, value and follow-

through, 3Com can undoubtedly put your network on a solid footing.

**Computerworld's
reader confidence survey shows
greater customer satisfaction with
3Com products and services than
with any of their competitors.*

Please call us and we'll gladly provide you with reprints of the article which quantifies the advantages of 3Com networks, or you may access the information directly on our website.

Print management

Burton Systems, Inc. in Waltham, Mass., plans to bundle a management utility free of charge with its SmartTalk for Windows NT directory and View 3.0 network operating system. Adtech Toolbus Ltd. from Scotland, Arls., will add server, service and mail management capabilities to the SmartTalk offering.

Mail savings

Ascend Communications, Inc. is shipping NetWay Pro, a device that lets integrated Service Digital Network (ISDN) users save on wide-area network charges by using the links to carry telephone calls. Today, many use ISDN lines for communications and a separate line for voice calls. NetWay Pro costs \$599.

Buyer's Web support

Buy Networks, Inc. has announced its Optivity software for managing its network devices, expanding switch support and enabling access to more reports through the World Wide Web. Now managers can view connections through their's Configurator and direct switched traffic to a specific port for analysis by an attached probe. Optivity Enterprise 3.1 application costs \$5,999. Optivity Campus 6.1 costs \$9,999.

Security upped in Novell server

• NetWare Web Server 3.0 beta demonstrated at Internet World

By Laura DiNo

IN A BIG boost to its presence in the Internet/intranet markets, Novell, Inc. made a series of announcements at last week's Internet World '96 trade show in New York. Novell's centerpiece was a demonstration of the beta version of NetWare Web Server 3.0, due in January.

And as a part of its effort to provide customers previous versions of forthcoming products, Novell also delivered a cached Hypertext Markup Language (HTML) package that will let users more quickly access Internet and intranet document pages.

Novell has buttressed NetWare Web Server 3.0 with its own advanced Secure Sockets Layer level security that encrypts Internet and intranet data transmissions.

Also new in the latest Web Server is a process for authenticating intranet clients in Net-

Ware's Novell Directory Service (NDS), which lets network administrators replicate the rights and access privileges of all users on a network. That means if a user is banned from a particular World Wide Web site, that information will be replicated throughout the directory; network administrators have to key in the information only once.

"That's an incredibly efficient mechanism and a big time-saver," said Bob Sakakeeny, an analyst at Aberdeen Group, Inc. in Boston.

Matt Dillon, network special at ITT Fluid Technology Corp. in Morton Grove, Ill., said that type of efficiency is essential for his company's end users. Novell, page 79

THE FINAL VERSION

NetWare Web Server 3.0 will be available in the final quarter of 1997. Its features will include:

- Secure Sockets Layer 3.0 encryption between Web servers and browsers
- Virtual directories for simplified management
- Increased performance
- Connectivity to Oracle databases
- Novell GlobalFinder search engine for indexing intranet files

SAS enhances tool for eyeing performance

By Patrick Dryden

SEEKING TO CATCH up with users' demands for client/server and intranet support, SAS Institute, Inc. last week enhanced its tools for examining the performance of systems and networks.

The developer of analytical business applications is re-vamping an SAS-language data warehouse and reporting suite called Computer Performance Evaluation (CPE).

Now called IT Service Vision, the package addresses the need for multiple SAS products and expertise in the SAS report-

SAS tool, page 73

"Now I can download performance data to a PC."

ways to
safely store all
the information
on the planet.

SAVE

Somehow, the smaller the world gets, the more its information grows. Each day, networked computers are making more kinds of information available to more people than ever before. From last night's sales figures to next year's economic forecasts, information is the lifeblood of business. And that makes managing and storing it even more vital.

At IBM, we're constantly thinking of new ways to maximize the value of information to your company. Part of which means understanding that different

kinds of users can have different kinds of storage needs. For some, the reliability of a 24-hour, seven-day-a-week system is critical. For others, having fast access is key. And with rare exception, cost is always an important consideration.

With all this in mind, we're adding a series of new products to our proven RAMAC™ Array - Family of storage systems.

If your focus is a low total cost of ownership, the RAMAC Virtual Array Model 2 is as economical as it is flexible. If growth is on your mind, the

fastercheaper

RAMAC Scalable Array lets you add both capacity and performance when your requirements change. Need more speed? The RAMAC Electronic Array gives users hyperfast access to stored data. And if your priority is simply the highest level of data availability, the new RAMAC 3 delivers it with twice the capacity and up to three times the speed of our earlier designs.

We're also making it easier to move into new technology. IBM® RAMAC Data Migrator is a service that transfers data from any 3990 or compatible

subsystem to any other 3990 or compatible subsystem, with minimal downtime.

All this is backed with the IBM service and support you've come to expect.

Only better. Smarter. Faster. Cheaper.

To find out how you can get more out of storage, drop by www.storage.ibm.com today or call your IBM representative.

Solutions for a small planet™

SAS tool examines performance

CONTINUED FROM PAGE 69

generation language. It splits the data warehouse between mainframe and Unix systems and enables simpler reporting through PC clients and World Wide Web browsers.

The product was designed to gather information from diverse sources, store it and present it in meaningful ways. This is much the same way the vendor's job-specific data warehouses help corporations understand the performance of their business processes.

For example, administrators can quickly check service levels for their users, analyze the current impact and project the future needs of applications. Or they can predict performance trends based on historical baseline data.

"The new package looks very helpful, since we have many field technicians without experience in the SAS language and tools," said Ken Tyler, principal network consultant at Bell At-

lantic Network Integration, Inc. (BANI) in Frisler, Pa. "Now I don't have to convert utilization and capacity analysis for them. They can access reports anywhere from a browser."

For the past two years, Tyler has used SAS' CPE to collect performance data from network management platforms and devices throughout BANI customer networks, archive it and create understandable custom reports — describing routers by location instead of IP address, for example.

EASIER TO USE

With IT Service Vision, BANI technicians won't need such a strong background in the SAS language and tools, Tyler said. He said he likes the PC client's graphical user interface for creating reports and presenting them in Hypertext Markup Language format for Web access.

Canned reports on network

performance analysis are available from other vendors, Tyler said. "But the SAS language capability lets us wrap more user-meaningful info into our reports," he added.

Mainframe performance evaluation is the focus for Erie Insurance Group, a SAS CPE user in Erie, Pa.

The biggest boon in the re-

vamped package is the desktop reporting, said Susan Fausette, senior performance management specialist at the insurer. "Instead of looking at separate sets of tabular data on the mainframe, I can build graphical reports on a PC with simple drill-down capability," she said.

For example, Fausette can graphically report average CPU utilization for the day and then let staffers dig down to examine statistics by shift, hour or 15-minute period.

The custom reporting capabilities common to the old and

new tool kits help Hudson Williams, Inc. answer complex performance and operations questions for managers of open systems and networks, said Neil Coffe, president of the New York integrator.

"They've opened the architecture to include the Web, phone systems and nontandard devices," Coffe said.

IT Service Vision is available from SAS in Cary, N.C. Pricing starts at \$65,000 for the first year for mainframes and \$15,000 for distributed Unix systems.

Allies line up for 56K bit modem standards

By James Nicolson

YOUR LEADING PC manufacturers have announced support for an effort by Lucent Technologies, Inc. and Rockwell Semiconductor Systems to establish a common technical standard for 56K bit/sec. analog modems.

AST Computer, Inc., Compaq Computer Corp., Hewlett-Packard Co. and Toshiba Corp. said

they will support K56Flex, the protocol proposed last month by Rockwell and Lucent that will interoperate between their respective VModem and K56Plus modem technologies.

The 56K bit/sec. modems, expected to ship early next year, will almost double the rate at which data can be transferred over standard telephone lines.

But a battle to establish a

common standard has emerged, with Lucent and Rockwell soliciting support for their K56Flex technology and U.S. Robotics Corp. pushing its x2 technology.

In the past two weeks, Hitachi Ltd. and Dell Computer Corp. have announced support for the U.S. Robotics standard.

Nicolson writes for the IDC News Service in Boston.

Your people will be so productive, you'll get to keep your job for another week

Throw in these and Microsoft's TCP/IP would be one heck of a freebie.

ministration's communications branch in Philadelphia. "They didn't like that, and I haven't heard from them in the weeks since. I've decided I'm going to go with the Bay Networks solution instead."

But users may pay a price for changing vendors. That could include the cost of retraining staff, new network management systems and intangibles such as breaking in sales representatives and engineers and building relationships with vendor executives.

When it comes to service and support, some would rather stay loyal than switch and pay a premium for better service.

"We're willing to pay extra for a higher level of service and support from our current vendors," said Peter Madams, a vice president at PictureTalk, Inc., a con-

ferencing software vendor in Pleasanton, Calif. But he said he won't tolerate broken promises made by vendors.

"We've had a [supplier] miss promised product delivery dates altogether, which is the worst type of problem for us because the cost of tying up staff is far more expensive than the cost of networking hardware," Madams said. "When this happens, we simply change suppliers."

Continued poor financial performance and senior manage-

"I... finally put it to [Cisco].
point blank, that I want my
money back."

— Bill Hurst

General Services Administration

ment changes are another reason to reconsider even long-running relationships, said Madams, who uses yCom and Cisco products.

"We wouldn't want to buy equipment from a vendor if we think they're going out of busi-

ness," he said. "We look closely at vendor performance, and it definitely affects who we go with and who we stay with."

With the acquisition and merger tsunami that leveled the internetworking industry this year, Gillespie would like to see

sales representatives and sales engineers that have a knowledge of their company's increasingly broad product lines.

"It's a real catch-22," Gillespie said. "You want these people to know their entire product lines. With all the industry con-

solidation, these people are frequently in training. So you need them to be able to back up each other. And it's just not enough for them to be knowledgeable on routers alone if their company sells routers, hubs, switches and network interface cards."

FOUR WAYS TO INTEGRATE E-MAIL SYSTEMS

Exchange workflow aided by third parties

CONTINUED FROM PAGE A9

integrated with Exchange. Using either the Keyflow development environment or prebuilt templates, users can build workflow routines that use existing Exchange functions for key application services.

Other workflow specialists, including Reach Software, Inc., Ultimatus and FileNet Corp., have also released products in the past few months designed to run on top of Exchange.

Using the underlying messaging infrastructure to route workflow documents is cost-effective and lets companies share the corporate knowledge locked in the messaging system's discussion databases.

For companies that have decided to standardize on Exchange for messaging, these workflow add-ons bolster a key weakness of the messaging

server: users said.

"Other than doing some really ugly stuff with Visual Basic, Exchange does not natively have the capability to route forms or do workflow," said Dave Livingston, Exchange architect at Norwest Services, Inc., the information systems division of Norwest Financial in Minneapolis. Norwest is testing Exchange with 600 users and expects to deploy it across the bank.

Exchange falls short of Norwest's workflow demands because it doesn't offer flexible forms that may be easily knitted together to form workflow routines, Livingston said. But the Exchange "server is a good platform on which to run workflow applications," he added.

A product such as Keyflow is very attractive to Exchange shops, said Chalmers Brown, a

Ten trends affecting the workflow market

- 1 Business process re-engineering
- 2 Move to standards-based software
- 3 Integration of imaging capabilities with applications
- 4 Ubiquitous computers
- 5 Desire for paperless offices
- 6 Migration to client/server
- 7 Growing popularity of optical character recognition
- 8 Low software prices
- 9 Vendor consolidation
- 10 Improved connectivity between workflow systems

Source: Association for Information and Image Management, Silver Spring, Md.

consultant at Adler Consulting Group in New York. "Companies can take advantage of the flexibility of developing workflow apps with Keyflow's easy-to-use tool and still leverage that Exchange backbone," he said.

Nikki Gomez, manager of software services at Standard & Poors in New York, said any workflow application the financial services company installs

has to work well with Exchange. The company is moving 1,500 users to Exchange and evaluating Keyflow.

Gomez said Keyflow caught his eye because of its integration with Exchange. Keyflow workflow forms are registered with an Exchange server, and workflow objects are stored in Exchange folders. Keyflow also uses the Exchange mail

directory services.

Gomez said he considered Notes, which has more evolved workflow support than Exchange. But he said Exchange and the workflow add-ons fit in better with the company's Microsoft-centric computing environment.

A WORK IN PROGRESS

Microsoft has postponed the server as a platform to route up workflow applications since it began shipping Exchange last April, but so far it has delivered little.

Microsoft will add collaborative features to Exchange in its soon-to-be-released Outlook client, which will enable users to generate forms and route them to others throughout an organization.

Microsoft later this year is expected to publish a set of workflow application programming interfaces for Exchange that will make it easier for software vendors to integrate their workflow offerings with Exchange.

Pricing for Keyflow is \$495 per client and \$1,450 for a server and five-client license.

Notes' remote access improved

By Barb Cole

XcelleNet, Inc. is readying software that improves the remote access capabilities of Notes by making its replication facility more efficient.

RemoteWare Essentials for Lotus Notes, can significantly reduce connection times for remote workers who use Notes, users said.

"Some connections went from over an hour down to eight or 10 minutes," said Dan Barth, a vice president and chief information officer at Pinnacle Brands, Inc., a sports trading card company in Dallas. Pinnacle has rolled out the RemoteWare utility to its remote sales force.

As many as 25% of Notes users access the software from remote locations via dial-up connections, analysts said. Al-

though Notes' built-in replication has been a boon for users, replication sessions can be tedious.

"With Notes, the process of replicating occurs online and can be very time-consuming," said Karen Scherberger, research director at Gartner Group, Inc. in Stamford, Conn.

DATA COMPRESSION

The RemoteWare Essentials utility improves throughput by compressing data to be replicated. It also detects and applies some changes in the source and replica databases off-line.

Barth said RemoteWare Essentials lets sales workers download more information, thus making them more-equipped for the job.

With RemoteWare Essentials, systems administrators can schedule automatic replication for remote workers.

"In one call, they can replicate their Notes databases, plus download key sales analysis information from our [online analytical processing] application," he said.

With RemoteWare Essentials for Lotus Notes, users may interact with a familiar Notes interface or a World Wide Web browser. The firm is working on a similar utility that will let users view Web pages off-line.

XcelleNet, in Atlanta, will ship RemoteWare Essentials for Lotus Notes next month. It costs \$75 per user and \$3,750 for 50 users.

Novell

CONTINUED FROM PAGE 49

"The Novell Web Server 3.0 ensures us of a high degree of security, and our network administrator finds it extremely easy to use," Dillon said.

Another key feature in the upcoming NetWare Web Server 3.0 is an indexing technology that lets administrators index the contents of a Web server or any LAN file server. That lets users and administrators do keyword and/or string searches for specific content anywhere on the corporate intranet or Internet.

NetWare Web Server 3.0 beta software can be downloaded for free from Novell's Web site at www.novell.com.

Customers can register for the software at support.novell.com/home/pubbeta/nws. The final version of the Web server software will be available in the first quarter next year.

Novell also used last week's Internet World trade show to release several test software packages. The Proxy caching gives

users faster access to HTML pages by storing frequently used pages in a local-area proxy cache such as a NetWare or IntratracWare file server. HTML pages are stored and updated based on frequency of use and file size.

Novell also released the following test software packages:

- Security Services to provide users with a firewall-class security framework. The security software is fully integrated with NDS to ensure that data transmissions are immune from unauthorized access.

- Virtual Private Networking services that work with IntratracWare's wide-area network routing options such as Point-to-Point Protocol over leased lines, Integrated Services Digital Network, frame relay and X.25. This ensures that data will be encrypted throughout the network.
- Remote Access Service to give users remote dial-in and dial-out capabilities to access corporate intranets.

- The Z-File Services storage system to deliver a scalable, portable back-up storage system that supports the current NetWare file system and Web services.

Introducing

CFO Vision

**THE POWER TO
FIGURE IT OUT.**

Stop crunching and start analyzing. With CFO Vision you can visualize your business interactively...and gain control of information to spot opportunities and risks faster than ever before. Reengineer the entire process of financial consolidation, reporting, and analysis...as you accelerate the flow of information to decision makers at every level of your organization.

With the click of a mouse:

- Understand the facts beyond the figures.
- Improve timeliness and availability of business reporting.
- Analyze every "slice" of your business—from branch profitability to product cost analysis—in any currency.

Powerful, award-winning data warehousing, OLAP, graphics, and EIS capabilities are all included in one fully integrated, easy-to-use solution. It's all yours from one vendor: SAS Institute, with a proven track record for continuous innovation and reliable support at more than 29,000 organizations worldwide...including the Fortune 100.

NetSuite smartens up its net software

By Patrick Dryden

NETSUITE DEVELOPMENT last week overhauled its namesake network design and documentation software in an attempt to simplify the process of representing the constantly changing components and connections on a network.

New functions and optional tools in Version 2.0 of NetSuite Advanced Professional Design address problems that early users

said made the software cumbersome and created network-planning roadblocks. The new version helps users keep updated as devices are added to their networks, said beta tester John Dunning, network systems specialist at Wayne State College in Wayne, Neb.

Such packages from NetSuite Development and other vendors combine drawing software with

intelligent analysis tools to examine the new or modified layouts. As the user records information such as each device's location, serial number and other support details in an inventory database, the tool looks up vendor-supplied specifications

"This is the one place we can keep an accurate network map and up-to-date information"
— John Dunning
Wayne State College

in a library. Then it validates the design by making sure the device supports the desired connection and topology.

These vendors target planners and managers who currently diagram a network with drawing software and hope that their connections are accurate. They also target those who separately log inventory information in notebooks or spreadsheets.

"But NetSuite's technical accuracy made the tool hard to use when my changes weren't included yet in the device library," Dunning said. "But now that's 100% resolved."

New options let users temporarily halt live testing of a network design to allow planners to sketch a design in "whiteboard mode." The planners can then globally transform one type of device into another to signify equipment that has been upgraded or replaced. Previous versions required manual changes networkwide or halted the design because the library didn't recognize a new device.

RIGHT TOOL FOR THE JOB

An optional tool kit helps customers model new items, such as a hub or switch that isn't listed in NetSuite's library of 3,000 devices. Managers also can prevent diagrams and details as hyperlinked documents for remote viewing from any World Wide Web browser.

NetSuite Advanced Professional Design 2.0 combines drawing and analysis tools

NetSuite Development in Wayland, Mass., now has competition from newcomers that include ImageNet, Inc. in Wellesley, Mass., and Network Tools, Inc. in Santa Clara, Calif.

The potential market is huge. Less than one quarter of corporate networking departments feel they maintain an accurate record of their networks, according to Yankee Group, Inc. in Boston.

"So far, tools to design and document the current state of a network have been nichey and impractical," said Rick Villani, an analyst at International Data Corp. in Framingham, Mass. Now three firms can help depict corporate networks without too much customization, he said.

NetSuite Advanced Professional Design 2.0 costs \$2,900. The optional tool kit costs \$1,000.

Update your database whenever you dial into e-mail.

(Now the only hard part is finding the phone jack.)

The easiest path to data replication on the road these days? E-mail. Thanks to SQL Remote™, a remarkable feature of Sybase SQL Anywhere™

Using any popular e-mail platform, SQL Remote enables database updates to occur bi-directionally, simultaneously and transparently. How? SQL Remote tracks changes in your local database and bundles them as e-mail messages. When you dial in for e-mail, changes are fired off to the head office system. Updates at the consolidated database are returned to your local database. The result? Perfect replication.

The same principle provides a Mobile Intranet.

SQL Anywhere Professional™ stores HTML pages from your corporate web site to its database at both the consolidated and local ends. After an e-mail exchange, your corporate URL (accessed locally and completely off-line, if you wish) displays all pages. All updates. All revisions.

No other database and replication package keeps you so easily and completely in sync with corporate data.

From anywhere. Found that phone jack?

You'll find a free evaluation
copy at the Sybase Web site
Or call 1-800-8-SYBASE

SYBASE

Managing documents

Information Dimensions, Inc., in Dublin, Ohio, is shipping Netix Version 3.0, an upgrade of its document management system that now supports very large databases. The feature lets companies manage collections of documents that contain fragments of information, according to the company. The new version also has an enhanced search engine and supports external indexes. The software runs on Windows NT and Unix servers. Pricing starts at \$4,995.

Reducing billing

Aerotech Corp. recently signed a multi-million-dollar contract with Novita Systems in Burlington, Mass., for a consulting system that will help aviation customers' long-distance, land, cellular and paging services on one monthly bill.

MFS plans nationwide rollout of high-speed line

By Kim Grard

MFS COMMUNICATIONS will soon begin a national deployment of high-speed Digital Subscriber Line (DSL) service to business customers who seek Internet access and remote connections.

The service, called IDSL, is a hybrid of Integrated Services Digital Network (ISDN) and DSL developed by MFS and Ascend Communications, Inc. in Alameda, Calif.

Using IDSL, data can be carried on standard phone lines at 28.8K to 1.5K bit/sec. speeds.

Unlike ISDN, IDSL is a dedicated service that targets users who stay on the Internet for long time periods. Because it is a dedicated connection, users will pay a flat fee rather than a per minute charge typical of ISDN. IDSL requires an ISDN terminal adapter on the customer's end. ISDN users can use their ISDN terminal adapter to upgrade to the new IDSL service.

MFS, the telecommunications carrier in Omaha that owns UUnet Technologies, Inc.'s Internet backbone, will initially introduce the service in California. The company plans to make IDSL available nationwide by the third quarter of next year; pricing hasn't been announced. The service promises home or remote users faster access to the Internet and corporate LANs.

ISDL service should be far less complicated to install at both the customer and carrier site than ISDN, said Michael Malaga, director of strategic development at MFS. Once a terminal adapter is installed at the customer's end, traffic will travel from that site to the carrier's central office to the Internet. But several ISDN users said DSL could suffer the same pricing, installation and availability issues that have plagued ISDN.

"If DSL has the same problems, it will have the same resistance that ISDN has had," said

The skinny on IDSL

→It is a hybrid of ISDN and DSL.

→IDSL service works on copper phone lines. Data travels from the user's location to the carrier's central office, where it is handled by an Ascend remote access switch. The traffic moves from the central office to a frame-relay network to the Internet.

→Users need an ISDN terminal adapter (\$800 to \$1,200).

Tom Lang, an IS manager for Los Angeles County, who works in Downey, Calif.

TOO FAR TO GO

Lang, an ISDN user, said he believes all DSL technologies will find a niche, depending on how they are priced and marketed, but he appreciates ISDN's versatility. Unlike an IDSL connection, his ISDN lines carry both

voice and data, he said.

Carriers also may need to invest lots of cash to recondition some telephone lines to carry data at promised speeds.

The service could bridge the gap for users who want speeds faster than the soon-to-be-available 56K bit/sec. modem but don't want to invest in a dedicated T1 line.

IDSL is appealing partly because it promises to relieve congestion on public telephone network switches that regional Bell operating companies claim is causing service problems. IDSL redirects that traffic across lines maintained by Internet service providers.

Malaga said the firm doesn't plan to deploy Asymmetric Digital Subscriber Line technology because it doesn't offer the same speeds to and from the Internet or corporate network—a drawback for business users who communicate with the home office. IDSL provides the same speed both ways.

ALLIANCE
FOR ENTERPRISE COMPUTING

• Administrators tighten control

Firewalls close in on network users

By Charles Babcock

FIREWALLS STARTED OUT as imposing, costly sentinels at the perimeter of the enterprise, but lately they have been getting less expensive and moving inside, closer to the end user.

That is necessary, from the point of view of network administrators who are worried that end users will find "backdoor" access to the Internet by dialing in to service providers using modems at their desks rather than going through the corporate firewall, observers said.

MORE TO COME

That and other concerns will be met by building more firewalls in the network infrastructure. They will one day be little more than "a bump in the wire," predicted Marcus Ramam, chief scientist at V One Corp., a firewall builder in Rockville, Md. Ramam was a speaker on the state

of the art of firewalls at the 23rd Annual Computer Security Conference in Chicago in November.

McAfee Associates, Inc. in Santa Clara, Calif., a month ago launched PC Firewall, which can be installed on any Windows computer. In its current version, it is basically a

stand-alone desktop product, but Version 2.0, due next month, will let a network administrator restrict incoming or outgoing traffic on PCs from a central Windows NT server. The firewall will cost \$47 per unit for 100 units or \$79 per individual copy.

Ascend Communications, Inc. in Alameda, Calif., recently offered to ship its low-end Pipeline routers with a firewall built in as a \$500 option. Enterprise firewalls typically cost \$14,000 to \$15,000. Without a firewall, Ascend's low-end Internet ac-

cess routers cost \$895 to \$995. The routers connect remote workers to the Internet over an Integrated Services Digital Network (ISDN) line, with the firewall protecting them from attackers.

Applied Cybernetics, Inc., an Internet consulting firm in Columbus, Ohio, last year replaced its general-purpose firewalls with Ascend's Pipeline 50 routers. Michael Hullhorst, senior systems architect, said the Pipeline firewalls are much easier to configure through a point-and-click Windows application, and a technically skilled secretary serves as systems manager after setup.

Hullhorst said his firm supplies Internet access to some of its clients and uses four Pipeline 50s to shield traffic of one company from that of others. The small units scale to Cybernetic

needs as it adds ISDN lines to clients. "It's a much more versatile solution overall," Hullhorst said.

Rik Farrow, an independent firewall consultant, said the Ascend products provide "a more rigorous set of rules" for protecting the home or regional office than was available through packet-switched routers.

At the same time, Ascend's Secure Access and McAfee's PC Firewall offer less protection than enterprise firewalls from such providers as Border Network Technologies, Inc. in Toronto and Checkpoint Technologies Ltd. in Redwood City, Calif., said Farrow, an instructor on firewalls for the Computer Security Institute in San Francisco. The latter can screen traffic to and from particular applications, such as electronic mail, whereas Secure Access and PC Firewall use less precise screening rules.

The perfect workstation for pragmatists.

Hoo baby, you're going to love Sun™ Ultra™ workstations. 'Cause your engineers get the super-computer performance they've been clamoring for (not some wimpy PC pseudo-workstation), at a price upper management can live with. Plus, Ultra workstations come loaded with the powerful Solaris™ operating system — so they network easily with what you already have. Which makes them a safe, smart choice that totally protects your current investment. And, since they work so well in multi-vendor environments, your marketing, finance and engineering people are working in synch. So your time-to-market goes down; your productivity goes up. Sun Ultra workstations are definitely the most practical workstations out there.

for power mongers.

Forum for commerce

Peoplesoft, Inc. in Concord, Calif., last week introduced a pair of software products designed to deliver electronic data interchange (EDI) over proprietary or private networks, or the Internet.

Temple PowerDoc and Tempus WebDoc shield users from the complexities of EDI with a screen-driven graphical user interface. PowerDoc for MVS is available now. It costs \$40,000. The Windows NT version is scheduled to be available by March and will cost \$6,000. WebDoc is the Internet version of PowerDoc. It will be available by March and will cost \$5,000. WebDoc and PowerDoc require remote software, which costs \$250 per copy.

Web mail

Ipworld, Inc. in Lexington, Mass., has rolled out an add-on that provides World Wide Web browser access to the World Internet mail server for Windows NT. The Web Messaging module is available now and costs \$25.

Appliance applications

Novell Communications, Inc. is a start-up in Sunnyvale, Calif., that develops applications for Internet appliances. The company's first offering, Novell Mail, is a Java-based mail client that will enable users to send mail, graphics, images and Java applets to the body of messages. Novell Mail is due in the first quarter next year, company officials said.

Playing tag with HTML rules

► Users want standards, compatibility

By Justin Hibbard

GETTING Internet browser vendors to stick to HTML standards is like getting jazz musicians to stick to sheet music.

Just ask information systems managers preparing for the beta releases of Netscape Communications Corp.'s Navigator 4.0 and Microsoft Corp.'s Internet Explorer 4.0. The two vendors' past failures to reconcile Hypertext Markup Language (HTML) support in their browsers have led to incompatible documents on corporate intranets. IS managers said.

"We used to have a lot of issues with [Internet Explorer] 3.0," said Joel Forsythe, a systems consultant at Tribune Media Services, Inc. in Chicago. "It

was mainly the layout. The pages would look different in the two browsers."

Tribune Media has standardized on Navigator. But inevitably, some business units use Internet Explorer because it is free and readily available. Forsythe said. Other IS managers at large companies reported similar renegade browser use.

"In a company the size of Boeing, you can't possibly tell people what to do," said Joe Meadows, World Wide Web proxy service product manager at The Boeing Co. in Seattle. Boeing has a site license for Navigator, but some employees

Layout-conscious users want standards so Web pages look the same in different browsers

use Internet Explorer and other browsers, Meadows said.

Adding to the problem is the fact that Boeing's intranet content is created by a different author in each department, Meadows said. "We tell them HTML 2.0 is the only thing everybody

can render reasonably well," he said, "but people are going ahead with most of the stuff in [HTML] 3.0 — frames and tables."

Features such as frames and tables have caused fewer problems since Microsoft began supporting them in Internet Explorer 3.0, Meadows said. But he said he would avoid using new formatting features in the beta versions of Navigator 4.0 until the features are standardized.

Navigator, due next month, and Internet Explorer, due this month, will adhere to the latest HTML specification approved by the Internet Engineering

Working Group.

With SWAT service, users can pay \$5 to have a virus removed, or they can terminate the session and pay nothing

SWAT battles viruses

► Online antivirus firm charges only for removal

By Gary H. Andes

IMAGINE GOING to the doctor for a physical and paying him nothing unless he finds something wrong with you — and then only if he cures you.

That's the approach taken by the Secure Web Anti-Virus Technology (SWAT), a virus-scanning service offered by Seven Locks Software, Inc. in Bethesda, Md.

Users can access the service free by downloading SWAT software from www.sevenlocks.com.

When executed, the software scans a Windows 95 PC's files for viruses. If none is found, the process ends, and the user pays Seven Locks nothing.

If a virus is found, the user may terminate the session or request that SWAT clean the PC with its virus-removal software. Seven Locks charges \$5, via a credit-card number entered online, to remove a virus.

The service might be deployed by a company that wished to avoid the costs and ad-

Third parties link 'net to PeopleSoft

By Randy Weston

PEOPLESOFT, INC. may not be quite ready to take its business applications to the World Wide Web, but plenty of companies are lined up to do the job for it.

PeopleSoft over the next few months will slowly roll out Version 6 of its business applications package.

Missing from the release, however, are any built-in Internet interfaces, features PeopleSoft competitors already have available or are preparing to release. Out-of-the-package Internet applications won't be available from PeopleSoft until the end of next year in Release 7.

The interfaces will let firms give casual users access to previously inaccessible functions of large packaged applications through a Web browser. The interfaces make possible items such as self-service human resources applications in which employees can use a Web browser to update personnel data such as address changes.

Third parties, page 88

John Curran

Internet reliability

BBN Planet is one of the dozen or so largest Internet service providers in the U.S. The company, which focuses exclusively on business, government and academic users, has 2,300 customers nationwide. Its parent company, BBN Corp., was instrumental in the founding of the Internet more than 25 years ago.

As chief technology officer at BBN Planet, John Curran sees the company's strategic direction. He recently spoke with Computerworld senior editor Mitch Weger in his Cambridge, Mass., office about Internet reliability and standards and competition among service providers.

Internet, page 88

SWAT battles viruses online

CONTINUED FROM PAGE A7

administrative headquaters of maintaining antivirus software on all its desktops.

"It's a pretty cool idea. I don't think anyone has thought of that before," said Jonathan Wheat, manager of the Anti-Virus Laboratory at the National Computer Security Association (NCSA) in Carlisle, Pa. Wheat said the service would appeal especially to home users who didn't want to pay \$50 or more for an antivirus product.

CHECKING VISITORS

Like Larry Mayer, an independent financial consultant in Arlington, Va., said SWAT might be used by a company on its intranet Web server to protect internal users. "When anyone touched the Web site, it would go off and see if that user had run the antivirus program with in, the last week," he said.

If the user hadn't, a script

could direct the Web server to scan the user's PC with SWAT, Mayer said.

David J. Stang, president of Seven Locks, said the company would work out an agreement with a company that wanted to run the software on an intranet server to offer its own SWAT service.

Peter Tippett, president of the NCSA, said the fact that the downloaded SWAT scanner always contains the latest updates offers a "pretty compelling" benefit.

Tippett said that in most large companies, a two-month delay is typical between the time a vendor updates its antivirus product and its installation on internal users. "When anyone touched the Web site, he could, at least in theory, be greatly shortened with SWAT," he said.

Michael Cob, president of CobWeb Applications in Surrey,

U.K., said he will use SWAT between once per day and once per week depending on how often he loads files onto his four PCs.

Cob said SWAT found and removed viruses on his PCs, which he infected specifically as a test.

VIROUS CAPTURE

If SWAT encounters a virus that it isn't yet programmed to remove, it automatically captures the virus and sends it to Seven Locks' laboratory for analysis.

At no charge, the company will remove removal software and send it to the user by electronic mail, usually within 24 hours, Stang said.

The software that scans for viruses and the software that removes them are both included in the SWAT package that is usually downloaded, with the removal software only activated when the user agrees to pay.

HELPING HANDS How PeopleSoft's new software can help your business		
Vendor/Product	Function	Price
Lotus/ Domino	Managing mailboxes new tools for building the applications and scripts built in PeopleSoft Self Installation	Starts at \$995

Net/Dynamics/ Net/Dynamics 3	Web server, application and development tool	Single-user application server starts at \$1,295

Third parties link PeopleSoft

CONTINUED FROM PAGE B7

So the Mississauga, Calif.-based PeopleSoft cut deals with several third-party vendors to develop Web browser interfaces for Web intranets so employees can access their enterprise applications.

Among the companies that offer such products for PeopleSoft applications are Lotus Development Corp., Net/Dynamics, Inc. and OneWare, Inc., all of which were demonstrating their goods at PeopleSoft's recent user group conference.

Analysts predict PeopleSoft won't be hurt by being late to market. The company, which started as a human resources application vendor and only recently ventured into financials and manufacturing, has thrived as a come-from-behind player.

"This functionality is very definitely appealing to today's buyers," said Judy Hodges, packaged applications analyst at International Data Corp. in Framingham, Mass. "But the acquisition of these types of applications will really take hold throughout the next two years. Companies are still developing their strategic plans for the Internet, so it won't immediately hurt PeopleSoft."

Some users said PeopleSoft need not hurry at all because the third-party fixes give them more functionality than they could get with an integrated product from PeopleSoft itself.

DOMINO THEORY

Domino has allowed Ostram Sylvania, Inc., in Danvers, Mass., to move beyond simply building Web intranets so employees can access their personnel files, said Roger Rudenstein, project manager of human resources information systems at the company.

The maker of light bulbs and other products uses Lotus' new Internet-ready Notes product, Domino, as the interface for PeopleSoft functions.

"Yes, it allows us to get out to the Web, but it also allows us to build more robust applications to the Web," Rudenstein said. "We have workflow going on over the Web and in production so people can set off a whole process from a browser. A line manager can now ask for a head count though the Web. It's much more than enabling a form. It helps us organize even our static pages."

Internet reliability and standards

CONTINUED FROM PAGE B7

Curran leads design activities for BBN Planet's network and service infrastructure with a particular emphasis on scaling, management and security issues.

CW: Is it inevitable that a company such as BBN would be bought or put out of business by a telephone company one day?

CURRAN: Consolidation presumes that everyone is working or aiming toward the same industry. But the Internet business is about computer-to-computer communications. And that's a very different business from the communications world, which is about copper, trenching, backhoes [and] wire.

When you take a look at what most of the customers are ordering for Internet services these days — sure, down at the bottom there's a form of wire — but most of the services people are looking at now are not communications services. They're computing services. It's Web hosting, it's security services, it's the mail, the news, the [Domain Name Service] and the support infrastructure that goes into the Internet service.

Customers want to get new technologies three months to six months after they're stabilized.

The software development community looks at that and says, "Sure, that's simple." But for a service industry, where the average deployment cycle for a new service or switch is measured in years, that's a big challenge.

CW: What would have to happen for Internet traffic to become as reliable as phones or fax or overnight package delivery?

CURRAN: We don't offer inter-provider guarantees now because you need enough providers to make that work.

You can't honestly expect an Internet service provider to warrant the performance of their competitor until all the providers step up to a certain level of service and we can do the necessary agreements among providers.

It's hard enough for me to offer guarantees on my own network. I'm not going to offer guarantees on a network that doesn't have a performance guarantee for its own customers.

Actually, I think the best way to solve congestion problems is a much stronger user community which votes with its dollars and insists on reliable service and moves to providers that provide it.

CW: It is becoming more or less difficult for multiple vendors to work together?

CURRAN: You have higher levels of cooperation among the service providers, particularly the larger service providers carrying a lot of the traffic, than we had in the past.

But the fact that there is a high level of cooperation doesn't mean there's a high level of knowledge. As acquisitions occur and as you have new companies entering the market, they don't necessarily have the track record of the experience.

I think we end up with the problems getting solved. We've just managed to spread the important technical dialogue out through a much longer period of meetings.

The good news is that at least people are talking. You have Internet providers hating in the darkness, not communicating with anyone.

That would be a problem. Because the Internet is changing so fast, everyone has to get informed of a change coming down and respond within months. That means that you can't have an Internet provider marching to the beat of a different drummer. It just won't work.

Playing tag with HTML rules

CONTINUED FROM PAGE B7

Task Force, according to Netscape and Microsoft. But Netscape has already announced that its browser will support at least one new proprietary HTML tag, a unit of code that formats text and graphics on a Web page. And Microsoft has left open the possibility of doing the same.

The new Netscape tag, <LAYER>, will let developers

position graphics on a page according to precise X and Y coordinates. It will also let developers layer multiple images and HTML documents over one another inside a browser window.

Microsoft intends to offer the same features but will wait for the World Wide Web Consortium to recommend standards for producing the effects.

QoS. All of this quality of service, built in, without any additional cost, is all done without upgrading. Because Intel Inside® built-in security goes hand-in-hand with CYBERSHIELD™ from Data General, combining the Intel Inside® Embedded Firewall, complete end-to-end digital protection, CYBERSHIELD from Data General™, DGLX Kill Switch Option with Kill Switch™, plus SDM, the software and application from Oracle™, the Open Market, and CYBERSHIELD running on Pentium®, Pro, Pentium® III, and Athlon™ processors, all the AV 2000™, this computer can run enterprise-wide applications and conduct transaction over the Internet and Intranet with the highest security currently available, just as major companies and government security agencies do. Ready to Combat Data General and learn how you can keep your data like this from disappearing.

French cards

Seven banks and credit-card companies have teamed up to automatically develop electronic cash cards for U.S. markets. The seven — the Citicard, MasterCard, Visa, American Express, Discover, Novus, and UnionPay — will purchase MasterCard USA franchises rights for the U.S. to develop electronic cash cards that can store electronic cash on an encrypted microchip. A separate firm, Monet International Ltd., which was founded in July by 17 international banking firms, has rolled out the same technology in Canada, Hong Kong and the U.S.

Europe's spend spree

European companies will be on an information technology buying spree during the next few years, according to a report by Frost & Sullivan, Inc., a market research consultancy in Mountain View, Calif. The European IT market, valued at \$77 billion last year, is expected to reach \$90 billion by 2000. Germany is the leading European market, with 21.2% of the overall market in 1995; France and the U.S. were valued at 18.8% and 16.2%, respectively. Frost & Sullivan said IT deal-makers and manufacturers will see fierce discounting prices and growing competition in coming years.

New management system keeps a lid on inventory

► Manufacturer had rough road to tighter control

By Thomas Hoffman

MANUFACTURING managers at Rohm & Haas Co. used to ask their salespeople to estimate their sales volume each month. In turn, the plants provided the amounts of specialty chemicals required to meet those forecasts.

The problem was that forecasting wasn't being tied to production. Rohm & Haas had an inventory system for each of the 30 countries in which it operated. And the \$3 billion company's 35 manufacturing plants of ten produced more resins or polymers than were needed.

As a result, Rohm & Haas' inventories and operating expenses were bloated. This left managers at the manufacturing plants as corporate "sipping boys" for overproducing, said

Software skills take backseat to business understanding

Packaging the big picture

By Julia King

WITH SALES projected to top the \$4 billion mark, vendors of packaged client/server applications have seen a banner year.

Now it is consultants' turn to make big money implementing the new software.

But sharp technical skills and configuration experience with an individual enterprise application are no longer enough to secure a well-paying position at consulting firms that specialize in package implementations. Instead, business knowledge and expertise in a specific industry are required.

"My advice to any young person would be to understand the manufacturing process and then learn the nuances of a particular package," said Ron Morris, president of J.D. Warren & Associates, a Carnegie, Pa., company that specializes in implementing Baan Co.'s enterprise software.

"I want people who under-

stand the supply chain process. I can teach them Baan," Morris said.

Part of what is driving the need for less technically oriented consultants is advances in the software itself. For example, packages from market leader SAP AG and fast-rising Baan include automatic configuration capabilities. That eliminates the need for consultants to manually flow through thousands of

said Alfred Grunwald, CEO of Deloitte & Touche Consulting Group/ICS in Chadds Ford, Pa. "What users want now is someone who knows SAP, knows their business and understands

Soft Link's Gretchen Artig-Swomley says the future belongs to the software specialist. Page 92.

software tables to get a system up and running.

Instead, what is needed are experts who can fine-tune the packages to incorporate the best business practices within a particular industry.

"The value-add is no longer in configuration consulting,"

their industry." ICS is retraining most of its SAP consultants to specialize in the automotive, telecommunications and other industries. "They'll look at a particular business problem and apply the best industry solution rather than look at it from a configuration standpoint," Grunwald said.

Packages, page 92

Healing the call center

By Jankumar Vijayan

BLUE CROSS of California hopes to provide first-call problem resolution and much shorter response times for customers who call the managed-care company's service centers.

In the process, Blue Cross also hopes to trim the average call time by about 15 seconds and keep its customer support lines open 24 hours per day, up from the current 15 hours.

Blue Cross' 1,600 service rep-

resentatives handle about 800,000 inquiries per month — each averaging more than 4 minutes — from health care providers, employer groups and individual policyholders.

"We are in the process of building a system that will allow us to provide responses to inquiries more quickly and productively," said George Steinhoff, vice president of group systems at Blue Cross. "It is the kind of service that we

BLUE CROSS Rx

Objective: To upgrade customer service centers and reduce average call time.

Solution: Migrate applications off mainframe to client/server architecture with integrated telephone features.

Technology used: HP 9000 systems, and HP PC servers, management middleware and HP SmartConnect software.

Status: Will upgrade 150 centers by the end of the year, the rest by middle of next year.

AS/400 shops need to tackle year 2000 problem

CONTINUED FROM PAGE 91

help or time left if shops want until they have to pay through the nose or rush through the work analysts said.

The year 2000 problem arises because computers store date information as two digits. As a result, most systems see every date as 19xx, and computers will treat 20 00 as if it were 1900.

2000-READY

IBM is trying to do its part by making CISC and RISC versions of the OS/400 operating system ready for 2000. That means the system will work properly without any changes in January 2000. Version 3, Release 2 and Version 3, Release 7 of the OS/400 and three newer AS/400 compilers are compliant in that way.

Earlier versions of the operating system don't provide such support and must be upgraded if users want to avoid problems in 2000, according to IBM. Users in on-line discussion forums have voiced concerns about the time and cost of upgrading to the latest and greatest operating system — when most of the installed base is still using older versions.

BellSouth Cellular is one company getting a head start reconfiguring its most important billing application with the help of a tool from Into 2000, Inc. in Japan, Ga.

"We wanted a tool that would not take up very much of [our] AS/400 resources," said John Sapp, year 2000 project manager at the Atlanta telecommunications company.

SAVES MONEY

Into 2000 lets users do most of the analysis and file rebuilding on PCs attached to the AS/400. That avoids bogging down the system and lets users avoid any impact from the year 2000 work. Into 2000 also ships with its own built-in methodology, which cuts back on consulting costs. Sapp expects the tool to cut the cost of programmer hiring by nearly 60%.

Analysts said the AS/400's integrated database and a slew of long-lasting and reliable pack-

aged applications give users an easier path to fixing the date problem than on other computer systems. For example, J. D. Edwards & Co. in Englewood, Colo., has up-dated its popular WorldSoftware suite to handle year 2000 dates.

"The way you deal with [the year 2000] on the AS/400 is pretty straightforward. That is a big competitive advantage" for both users and IBM as a vendor, said Al Barza, president of Barza Consulting Group, Inc. in Port Chester, N.Y.

DECISION

Even with that advantage, many AS/400 shops still don't know how they will attack the problem. Forty of 100 AS/400 sites haven't decided what actions to take for the year 2000 problem, according to a recent survey by Information Resource Group in Sterling Heights, Mich. (see chart, page 93).

But users still on the fence should note BellSouth Cellular's experience.

Even with his company's early start and time savings with Into 2000, the conversion of the billing application at BellSouth Cellular won't be completed until next summer, Sapp said.

That could bode ill for shops that expect to hire expensive programmers and outside help — especially small AS/400 sites that don't have the staff or time to deal with the problem themselves, analysts said.

Call-response management

CONTINUED FROM PAGE 91

feel will give us an edge."

The improvements stem from a combination of hardware, middleware and computer telephony integration technology that Blue Cross is implementing.

PHASING IN

Steinbock said Blue Cross plans to complete its project in phases.

In the first phase, most applications and databases will con-

Packages

CONTINUED FROM PAGE 91

The rest of ICS' consultants will continue to function as technical experts, focusing on the complex task of integrating new packaged software with legacy systems and other packages and with the Internet.

In the long term, integration is an area where demand for technical consultants will remain high, said Josh Greenbaum, an analyst at Hurwitz Group, Inc. in Newton, Mass.

"There's always going to be some development and integration that will have to happen outside of the [packaged] software, and this is not the domain for your typical in-house [IS] development unit," he said.

Software is the key

Unlike several of his counterparts, Gritschner Arvig-Groeninger, president of Soft Link, Inc., maintains that the brightest job prospects belong to those who specialize in a particular software package, rather than a specific vertical industry. Soft Link implements PeopleSoft, Inc. applications.

"People don't implement generic technologies. They implement packages," Arvig-Groeninger said. "In this market, it's only the people who specialize in a software package that will have long-term viability."

For now, research already shows that people skilled in client/server packages, especially PeopleSoft, are in high demand, says industry analysts. PeopleSoft skills were a premium of 30%, according to Computerworld's 1996 skills survey [CW, Nov. 10].

PeopleSoft experts are in such demand that Mapleswood, Minn.-based Soft Link's 60-person staff is constantly under siege by recruiters.

"People will go to unbelievable lengths to get the names of our employees. They'll stop at nothing," Arvig-Groeninger said. Recruiters have passed on potential clients several times. Another time, a recruiter passed on a Computerworld reporter working on a story about the life of a PeopleSoft consultant. — John King

Keeping a lid on inventory

CONTINUED FROM PAGE 91

global supply chain, Rohm & Haas in 1995 began to install a \$750,000 IBM VM-based materials management system from Rockville, Md.-based Manugistics, Inc. The materials management system is expected to help Rohm & Haas slash its inventories by \$100 million by 1998 by creating a more integrated supply chain among international facilities.

To make these improvements, Rohm & Haas had to re-engineer its order taking and purchasing activities among its sales forces, raw materials operations and finished products plants. The company selected the Manugistics package because it linked well with the company's transaction and order-entry systems.

But the re-engineering didn't come easy. "Quite frankly, we did a lot of floundering around,"

Gilbert said. For example, senior management had to accept responsibility for sales and planning while the sales department tackled a new process for demand planning, he said.

It wasn't until Rohm & Haas hired outside consultant Paul Polite in late 1995 that Gilbert

was able to convince the chairman's office of the need to re-engineer business processes. Polite showed Rohm & Haas "that we didn't have a prayer of getting a return on our IT investments unless we re-engineered our business processes," Gilbert said.

If the December sales forecast for monomers, a chemical compound, is trimmed for Eastern Europe by 5%, the changes can be entered into the system, which notifies the raw materials plant in Houston to curtail production. By tying the company's

forecasting, inventory and ordering systems together, managers around the world can rely on a single point of entry for product and inventory information.

Rohm & Haas expects to complete its final software installations at manufacturing sites in Kankakee, Ill., and Charlotte, N.C., in February and at a plant in the Philippines later next year.

So far the software has helped the company reduce its inventory costs by \$40 million. Gilbert placed the cost of the company's worldwide supply chain management efforts, including business process re-engineering expenses, at \$50 million to \$60 million.

Supply chain management is a problem that is dogging manufacturers in most industries. Companies "have built their businesses by hedging their sales forecasts" between stand-alone operating units, said Anna Grackin, partner of the supply chain practice at benchmarking Partners, Inc. in Cambridge, Mass.

prise Unix servers, HP PC servers and software for managing and integrating telephony-based customer service offerings. In the process, the company will also replace an dumb terminals that feed off the mainframes with PC server front ends.

THICK AND THIN

"We wanted to have a thick server/thin client implementation, as opposed to having all the [telephone] middleware sit on desktops," Steinbock said. "This makes things easier when you start moving toward the Internet."

Once the systems are fully implemented — by the middle of next year — all calls to Blue Cross will be handled by an interactive voice-response unit that is also integrated with the customer database. The unit prompts users for specific responses and puts details such as benefits, claims and eligibility information in front of the representative to whom it forwards the call.

The approach minimizes the time taken to handle the call and lets the customer resolve questions with just one call, Steinbock said.

END TAXA

NCs: For the kids
Network computers are vital to the well-being of our children in the Information Age. Peter G. W. Kent argues. Page 100

OUTSOURCED and HAPPY

The word outsourcing conjures up feelings of anxiety, anger and helplessness. But some "rebadged" IS professionals have found contentment and opportunity after their old companies farmed out their jobs.

Joe Love was reassigned to Origin Technology, a Web-suspicious company. Now, about two years later, he says, "I get satisfaction... that I am contributing to the bottom line of my company."

BY LESLIE GOFF

When Joe Love arrives at his office in Arlington, Texas, every morning, he makes himself a hot cup of coffee in a kitchen that was once a cluster of cubicles.

He's been working in the same building for more than 15 years, but a new shingle hangs outside. A new company logo graces his paycheck. But the change Love has felt most profoundly over most of the past two years is more than cosmetic. The database systems group manager says he feels he is more valuable than ever.

"I get the feeling... that I am contributing to the bottom line of my company," says Love, who was "rebadged" from Houston-based Halliburton Energy Services to Princeton, N.J.-based Origin Technology. "I've gone from being part of a cost center to someone who generates revenue."

Love is part of a growing segment of information systems workers whose jobs, because of outsourcing arrangements, have been reassigned to the outsourcee but who continue to work in the same location alongside the same co-workers. Yet Love says that before he began to feel so enthusiastic about his rebadging, he went through a period marked by denial, anger and, finally, acceptance.

At first, he was suspicious of his longtime employer's motives. After all, he had been in the oil industry for 15 years, and giving up his identity as an oilman was tough. He was also anxious about whether the outsourcee would commit to him.

But for Love and other IS professionals who have survived the initial anxiety and loss involved with a rebadging, their new employment status has been a boost. Outsourced IS professionals, they find, really do have more fun. They say they enjoy better training, a higher salary ceiling and increased job stability.

"There's an alignment of core competencies between what an IS professional does and what the new employer does, which tends to increase the gratification of the employee," says Frank Castle, executive director and co-founder of The Outsourcing Institute, a research firm in New York. "If

Outsourced, page 96

OUTSOURCED and HAPPY

CONTINUED FROM PAGE 95

you're an IS pro in an IS services organization, there's virtually no limit to how high up you can move."

ENCHANTED HONEYMOON

At California Federal Bank, an unanticipated and lengthy delay in obtaining regulatory approval for its deal created a long honeymoon for the bank's data center employees and the outsourcing vendor, Alltel Information Services Co. in Little Rock, Ark.

"When the bank first announced the deal, it was an extremely nervous time," recalls John Boynton, then telecommunications manager at the bank's Rosemeade, Calif., data center. "You hear all the war stories, and you don't know what the outcome is going to be."

It was 1991, and the recession was taking hold in Southern California. Boynton, who helped write the bank's outsourcing requests for proposals, says that as a manager, he was concerned for his staffers; as an employee, he was concerned for his career.

"In retrospect, working for the bank, we were in positions we couldn't move out of," Boynton says. "Now we can look at other accounts and other locations. We have a lot more flexibility with Alltel. And training is a definite plus."

California Federal renewed its deal with Alltel last December. Boynton is now an account manager at the company.

MARRIED, WITH CHILDREN

For Mary Fairbairn, an AS/400 systems analyst formerly employed at Filene's Basement Corp.

in Wellesley, Mass., accepting her rebadging to Andersen Consulting was painless — a matter of merging career and family goals.

"The reaction in the room was mixed, but mine was quite different," she says. "For me, the idea of being able to go to work for a larger company, to be involved in business process management, but to have the same office to go to every day was very attractive. I have a family I need to be here for."

Fairbairn also says her attitude toward the change was shaped by her boss, the company's vice president for application systems, Elizabeth Aiken, who outsourced herself along with her team. The rebadging turned out to be fortuitous. Not long after the outsourcing deal took place, Filene's was forced to begin closing a number of discount retail outlets and downsizing its ranks.

WORKING ON THE RAILROAD

Bill Malin, an independent strategic IS management consultant in Annapolis, Md., found an identity crisis among IS employees who had been rebadged by a major railroad.

"There's something so romantic about trains that people view themselves as railroaders first and IS professionals second," he says. "They had all spent a lot of time in the company and now could no longer identify themselves as part of the industry."

Moreover, once the outsourcing vendor took over the railroad's IS operations, the IS staffers were upset by their new employer's seeming ignorance of the railroad's lifeblood.

"I think there was frustration across the board that the new ven-

dor did not understand the urgency of timely service," Malin explains. "The vendor's staff had internalized the idea that a railroad is a [24 hour per day, seven-day per week] proposition. To railroaders, having the computer systems up and running is life and death, and the vendor just didn't get it at first."

ALL'S WELL THAT ENDS WELL

The substance of Love's job at Origin is the same as it was at Halliburton, but the big picture is substantially different. He has broader responsibilities, managing several accounts that encompass the insurance, shipping, manufacturing and high-technology industries and his former employer. After spending 15 years in oil field management, he's rounding out his technology expertise with newly acquired business perspectives.

"Learning the different industries has been the fun part," he says. "You get to go out and see how others have accomplished things. You begin to see new ways of doing things that maybe you hadn't thought of before."

Love says he stuck out the transition thanks largely to the advice of a former colleague who had been rebadged a couple of years earlier. "Halliburton had been selling us how much better it would be to work for a company whose core business was IS because the attitude toward us and the overall atmosphere would be better," he says. "My friend verified all that for me. At the time, I doubted it, but it has absolutely turned out to be true."

Goff is a freelance writer in New York.

DOING IT RIGHT

Management decisions about how to communicate an outsourcing arrangement and new employee policies for reassigned workers can impart a subtle yet strong message to other parts of the company, says Tracy Bernasek, advisory services manager at The Outsourcing Institute.

Outsourcing is called most successful when no one can see the difference between the retained internal staff and the out-

sourced staff, Bernasek says. Both staffs should have

the same dress code and holidays and be included in the

same activities, such as company picnics. Although it may

not be practical to maintain an employee perks forever, he

recommends a temporary period in which outsourced employees are gradually weaned off their former benefits.

"I worked with one old, family-owned company where people had put in lifetime, and their parents had worked there," Bernasek says. "One employee asked if they would still get their Christmas turkeys. You really should continue these things they feel a part of."

Filene's Basement, which outsourced its application systems group to Andersen Consulting, immediately cut all the outsourced employees' perks, such as their 30% retail discount.

"Losing the discount hurt," says Elizabeth Aiken, the group's vice president who outsourced her own job along with her staff. Being stripped of all identity as a Filene's employee bruised the IS staff members' feelings and left and years confused about how to interact with the rebadged Andersen employees.

But be aware that even the best management efforts won't engender 100% enthusiasm about a reassignment, says Frank Casale, executive director of The Outsourcing Institute. — Leslie Goff

Outsourcing is called most successful when no one can see the difference between the retained internal staff and the outsourced staff.

FEELING THE PAIN

Advice for IS managers on handling transitions to outsourcing

Although every outsourcing deal results in some natural attrition, IS management can minimize fallout and anxiety among rebadged IS staff by doing the following:

- Acknowledging their sense of loss and streamlining of identity.
- Bringing the outsourcer in to work side-by-side with the rebadged staff prior to the actual changeover.
- Focusing on the outsourcing arrangement as an opportunity for sustained career mobility, better training and professional development and increased job stability.

"Don't pretend that it's business as usual. Be aware of the people side of the whole equation."

— Stan Lepeck, program director of Advanced Information Strategies Service, Meta Group, Inc., Stamford, Conn.

DOES YOUR JOB **DEPEND** ON AN **ACCURATE** FORECAST OF THE **FUTURE?**

CEOs... CIOs... Research Managers... MIS Managers...
Engineering Leaders... Researchers... Teachers... Analysts...

THE ACM97 CONFERENCE

THE NEXT 50 YEARS OF COMPUTING

SAN JOSE, CA, USA MARCH 3 - 5, 1997

THE TECHNOLOGY LEADERSHIP IN COMPUTING AND COMMUNICATIONS WILL COME
TOGETHER AT ACM97 FOR THREE DAYS OF HARD-HITTING FORECASTS:

Gordon Bell, "father of the minicomputer" and Microsoft Sr. Researcher, on the folly of prediction.
Joel Birnbaum, pioneer in RISC and Sr. Vice President for R&D at Hewlett-Packard, on the evolution and impacts of electronic and non-electronic, biological and optical computing technologies.
Vinton Cerf, "father of the Internet" and Sr. Vice President of Data Architecture at MCI, on the future of the Internet.
Bran Ferren, Visual Special Effects Academy Awards winner and Executive Vice President for Creative Technology/The Walt Disney Company, on the long-term impacts of information technologies on entertainment and story-telling.
Fernando Flores, former Finance Minister of Chile, philosopher, author, entrepreneur and Chairman of Business Design Associates, on the future of business communications.
Murray Gell-Mann, professor and co-chair of the Science Board at Santa Fe Institute and 1969 Nobel Prize winner in physics, on the convergence of physics, biology, and information technology.
Brenda Laurel, actor, author, and researcher in computers and theater arts at Interval Research Corporation, on how the notion of "what computers are" is evolving.

MASTER OF CEREMONIES: James Burke, science journalist on the Discovery Channel and *Scientific American* columnist
CONFERENCE CHAIR: Bob Metcalfe, Ethernet inventor and Vice President of Technology, International Data Group

More than talk! In addition to the Conference, The ACM97 Expo brings together high-tech exhibitions from industry leaders, a SIGGRAPH animation theater, and pavilions showcasing products that will change our lives over the next 50 years. Attendance at the Expo is open to the public, free of charge.

Conference attendance is limited. Contact ACM97 Conference Registration at 800-342-6626 (US and Canada), or +1-212-626-0500 (worldwide).

Registration and information by email at ACM97info@acm.org. For updates, visit our web site at www.acm.org/acm97
Conference Registration Rates: ACM Voting/Associate Members: \$300 ACM Student Members: \$100 Nonmembers: \$750
Each Conference Attendee will receive a copy of the commemorative book
Beyond Calculation: The Next 50 Years of Computing, edited by Peter Denning and Bob Metcalfe.

EXECUTIVE
TECHNOLOGY
SUMMIT '97

May 19 - 21, 1997
The Pointe Hilton Resort
at Squaw Peak
Phoenix, Arizona

**A Dynamic Forum Where IT
Executives Get Answers On:**

- Distributed Computing
- Data Mining and Data Warehousing
- Doing Business with Internet Technologies

Technology Panels

The following three, 60-minute case-study panels discuss technology applications and implementation, including performance expectations, scope, process and return on investment.

Distributed Computing

Monday, May 19, 1997
Moderated by: Alan Alger
Editor, *Magazines Group*
Computerworld

The effective use of distributed computing technology rate on new challenges for the IT executive. The following issues will be discussed to help you separate promises from reality and to effectively estimate the impact on your resources:

- migration of existing systems
- increased need for object-oriented development
- systems management procedures
- user management and related fundamental security issues
- adequate hardware and software compatibility
- language standards and interoperability

The 1997 Executive Technology Summit Harvesting Your IT Investments

As we approach the year 2000, business is being irrevocably changed. Whole industries are being reshaped by the forces of increased customer expectations and dramatically shortened time to market cycles. This raises the question, "How can I increase my yield from my IT investments?"

The fourth annual Executive Technology Summit is being presented by SIM and Computerworld, to offer attendees more insight into the ever changing world of information technology. This unique program includes: keynote presentations, where IT visionaries offer first-hand accounts of technology solutions; technology panels, where CIOs are queried by highly respected industry analysts, consultants and editors; technology provider strategy panels, offering perspectives from sponsoring companies' CEOs or CTOs; and Solution Labs, where leading suppliers share their IT expertise.

Powerful Keynote Sessions

John Cross
British
Petroleum

John Siegel
Pace
Technologies

Robert Johnson
Research Board

Kicking off ETS '97 is John Cross, General Manager of IT for British Petroleum PLC. Cross discusses the "Transformation of the IT Functions at British Petroleum" as they moved from a mainframe VMS environment to client/server. A special Integrator keynote has been added to the program, this year, featuring John Siegel, National Internet Technology Director, Leader of Pace Technologies. The closing keynote is presented by Robert Schlegel, Senior Partner of the Research Board, who will share some of the data collected by his exclusive organization.

Technology Provider Strategy Panels

Here is your chance to hear from a senior level IT executive from an ETS sponsor company in a moderated panel format. Corporate strategies and future directions are revealed, as well as answers to questions about new technologies and emerging trends. Hear their stories and learn what you need to know about these companies in order to make beneficial IT investments.

Solution Labs

See for yourself, the latest technology solutions from today's top IT vendors. Leading suppliers share their vision and expertise. In these small, highly interactive educational forums, explore specific solutions to the issues facing you and your organization.

Data Mining and Data Warehousing

Tuesday, May 20, 1997
Moderated by: Alan Peller
Director, Research and Education
Data Warehousing Institute

Many issues plague the IT executive attempting to implement a successful data warehousing or data solution for their enterprise. Here's your opportunity to get the answers to the following questions:

- what kind of infrastructure is necessary to support the amount of data that will be stored and processed?
- do I need a relational database or multi-dimensional database?
- what set of tools will most appropriately support end-user needs?
- what are the real capabilities, the relative costs and the return?
- should analysis happen on the desktop or on the server and who has what level of access?
- search engine, text retrieval engine and sort processing options

**Doing Business with
Internet Technologies**

Wednesday, May 21, 1997
Moderated by: Gay Striegler
Vice President,
Giga Information Group

What are the viable solutions, the costs and the expected return from the corporate business perspective when doing business with Internet technologies? This is your opportunity to discuss solutions on:

- choice of architecture
- security and standards issues
- capitalization of the Internet for Internet purposes
- infrastructure support issues
- planning for effective use of the Internet beyond the year 2000

And again, this year's ETS conference will be hosted by our Master of Ceremonies, Scott Shawer, Founding Editorial Director, Business Week Conference Programs.

For more information or to register for ETS '97, call 1-800-464-0061 today! Or visit our website at www.computerworld.com or SIM's website at www.simnet.org.

Come meet and visit with the following ETS '97 Sponsors:

RESOURCES: IS MANAGER'S BOOKSHELF

Planning and Designing the Data Warehouse

Edited by Ramon Berquin and Herb Edelman

Prenice Hall PTR, Upper Saddle River, N.J.; 297 pages; \$39 (hardcover)

On paper, data warehouses make sense as specially organized collections of data that let users do detailed queries without crippling operational systems. In reality, data warehouses can be multiyear, multimillion-dollar projects that can blow up in an information systems manager's face.

This collection of essays is a useful, if somewhat superficial, introduction to data warehousing. For business managers, it provides a fairly complete outline of what it takes to plan, cost-justify, build and manage a data warehouse. It also provides questions that help users evaluate the amount and type of data they will need in the warehouse. But the essays gloss over some potentially major prob-

lems, such as the political and cost issues that arise when creating an enterprise data model.

There are some strong sections for IS managers, particularly the detailed descriptions and suggestions in the areas of database design and choosing the proper online analytical processing technology. There also are helpful tips on how to cost-justify the data warehouse, find executive sponsorship and manage user expectations. But too many of the essays provide bland descriptions of warehousing products without mentioning their failings, such as the shortcomings many users have found in the off-the-shelf tools for extracting complex data sets from operational databases for

their warehouses. There's only a passing reference to the Internet, and intranets — an increasingly popular method for accessing warehouses — aren't mentioned.

Despite the flaws, this is a worthwhile basic reference for business or IS managers trying to understand data warehousing. — Robert L. Scheier

Information Technology Outsourcing Transactions: Process, Strategies, and Contracts

By John K. Halvey

and Barbara Murphy Melby
John Wiley & Sons, New York; 350 pages
plus disk; \$45 (paperback)

Halvey, a top outsourcing attorney (his clients have included Xerox Corp., McDonnell Douglas Corp. and AlliedSignal, Inc.), and his associate have hatched a thorough tome on the legal side of outsourcing.

The book includes 160 pages of advice

on every aspect of IS outsourcing, from planning and requests for proposals through negotiation, financial and personnel issues.

There are also chapters on transitional outsourcing and international transactions. Perhaps you can get some of this advice from the zillions of articles on outsourcing, but you probably won't find 400 pages of forms, checklists and sample documents to help you negotiate and manage your contract. (They're also supplied on the disk.)

It's dense, but an attentive IS manager can use it as a reference or guide. Considering how much you have to lose on a bad outsourcing contract, the price for this book is a bargain. — Allan E. Alter

PETER G. W. KEEN

NETWK COMPUTERS: DO IT FOR THE CHILDREN

The \$500 network computer may or may not destroy the Microsoft business model, make Java the Cobol of the multimedia era or turn the Internet into an appet equivalent of the Library of Congress.

There are so many arguments for and against the network computer becoming the new mainstream and so many uncertainties that no one's prediction, mine included, is more than a guess, a wish or a vested interest.

I hope it happens for a very simple reason: The network computer is vital to the well-being of our children.

To be left out of the information revolution is to be locked out of the information economy and the mainstream of jobs. PCs are creating electronic haves and have-nots. Yes, it's astonishing that \$1,500 buys you a fully loaded multimedia machine, but that's still a heavy burden for the ordinary household, and it's an impossible one for many schools.

Far from enthusing about how many PCs are out there and how the Internet will change education, we ought to be much more concerned with how relatively few PCs are being used widely, actively and often. Venerable Apple IIIs still sit on

many desks, and 486 machines are rarely being replaced with machines that can exploit the multimedia facilities of the Internet.

Most kids get only occasional access to PCs. Support costs for Windows 95 and LANs are the same for schools as for businesses. And if you compare the jump in complexity and obsolescence from DOS to Windows 95, the thought of moving to new versions of Windows in the future must bring shudders.

Let's accept that network computers may not be a major replacement for standard PCs in business. That doesn't alter their social importance. It also doesn't negate the economic opportunity they represent: the cellular gateway.

Cellular telephones are rarely sold as full-price retail products; they come outpriced in deals from cellular service providers. A typical ad offers a "free" phone for a \$19.99 monthly service contract, with enticements of free minutes and

free weekends. The electronic product is the loss leader for the service. That's the obvious opportunity the network computer offers. How soon before we'll see banks offering their own branded network computer marked "cable ready" as the access tool for their services, with the Internet bundled in "free" with one month of free use of 50 nifty Java applets? Will phone companies or cable providers similarly subsidize the device to get the service volumes?

Once the PC has a subsidizing sponsor who can slash the price and still make profit, the economic base of computing changes. That would pull many families and schools back into the information economy. It's obviously also far easier for schools to raise money for 20 network computers than for 2000-to-be-obsolete PCs.

Because the Internet is fundamentally a multimedia universe struggling to get free from the constraints of slow bandwidth, only muscle PCs can meet today's needs. If that continues, so will the widening haves/have-nots gap. To close it for good, multimedia has to be on the 'net, not in the PC hardware and software. The bandwidth is coming — with so much demand that supply is sure to meet a wall within three years.

All this is just wishful thinking. I hope many IS people share the wish. Let's get away from optimist and predicting to influencing. There are too many dogmatic articles about network computers which say, "Never" ... "Dumbest idea I've heard" ... "Can't work."

Perhaps. The question shouldn't be, "Will it happen?" but "Do we want it to happen, and can we help it happen?"

Depending on the month, Keen is an author, consultant, public speaker or professor in Great Falls, Va.

What's the net net?

Microsoft Internet/Intranet Solutions.

Come to a free, half-day briefing and find out how the right solutions can help your company work smarter—and more profitably.

As you know all too well, talk is cheap, but technology isn't. That's why we're cutting through all the chatter to provide you with a strategic overview of new technologies which can help keep information, work and profits all moving together.

You'll get an inside look at Microsoft technologies for today and tomorrow, including highlights of the latest Internet/Intranet developments and how they're incorporated in many of our products. You'll observe the latest Microsoft-based solutions for taking advantage of Internet business opportunities, maximizing the benefit from communication-enabled line-of-business applications, enhancing team collaboration with a company Intranet, and more. You'll see first-hand how Microsoft Solution Providers are

uniquely qualified to provide you with solutions at an unprecedented level of functionality. And you'll have a chance to sign up with a Solution Provider to conduct a customized evaluation of Microsoft Internet and Intranet products, the latest version of Microsoft Office, Windows® 95, BackOffice™, and development tools.

If you're a business decision maker or information technology professional in an organization with 100 or more employees, and you need to use technology to accomplish business objectives, this briefing is for you.

Call (800) 836-8282, Dept. AT78 today to get information about a briefing near you.

EXECUTIVE TRACK

Victor L. Fischer was named chief information officer at **Connect, Inc.**, a provider of Internet-based interactive commerce and order management application software. Fischer formerly worked at Xilinx and Mips Computer Systems, Inc. Connect is in Mountain View, Calif.

Richard J. Ransell was named vice president and CIO at **WellPoint Health Networks** in Woodland Hills, Calif. He was executive vice president and CIO at Summit Bank in Chatham, N.J.

Joseph P. Bolduc was named CIO at **Fisher Scientific International, Inc.** in Hampton, N.H. He has more than 20 years' experience in the information technology field and most recently was a manager at Oracle Corp.

David P. McNicholas has joined **HFS, Inc.** in Parsippany, N.J., an executive vice president and CIO. HFS is a global consumer services company. It owns Avix, Inc., the rental car company.

Dean Rehmel has joined **PJA Merchandising Services, Inc.** in Irvine, Calif., as senior vice president and CIO. He was director of IS at Fedco, Inc.

Jeff R. Scherb was named senior vice president and chief technology officer, a new position, at **Tribune Co.**, a Chicago-based information, education and entertainment firm. Tribune publishes four daily newspapers, including the **Chicago Tribune**. Scherb formerly worked as a vice president at **Dun & Bradstreet Software**.

Delmar Steamer was named vice president of IS at **Pleasant Holidays**, a travel company in Westlake Village, Calif. He has more than 30 years' experience in computer systems and software development and enhancement.

Carolyn S. Davis was promoted to vice president and CIO of information services at **KTEC Electronics**, the contract manufacturing subsidiary of **Kent Electronics Corp.** in Houston. She was IS manager at KTEC.

Michael F. Kresley has joined **Individual, Inc.** in Burlington, Mass., as senior vice president of engineering and chief technology officer. He most recently was a vice president at **AT&T New Media Services** in Cambridge, Mass.

Steve G. Land was named vice president of information technology at **Bowater, Inc.**, the largest producer of newsprint in the U.S. The company is in Greenville, S.C.

Thomas A. Greenwald was named executive vice president and CIO at **StockNet, Inc.**, a multimedia entertainment company in New Paltz, N.Y.

Jerry Dean Campbell was named the first CIO at the **University of Southern California**. He will continue to serve as university librarian and dean of university libraries.

Buddy Pickler, senior vice president of MIS at **Ingram Book Co.** in La Vergne, Tenn., was named CIO at **Ingram Book Group**. Ingram is a wholesaler of trade books and textbooks.

James "Zuke" Zaccoli was named CIO and vice president of IS at **PC Service Source, Inc.** in Dallas. He has 15 years' IS experience. PC Service Source supplies service logistics to service providers and OEMs in the PC industry.

Wollaston B. Morin was named vice president of IS at **Hill's Stores Co.** in Hills, Canton, Mass., is a discount retailer. Morin was most recently vice president of IS at **Stride Rite**, a shoe manufacturer/retailer in Lexington, Mass.

Mark A. Lega was named division vice president of IS at **Nalco Chemical Co.** in Naperville, Ill. Nalco makes and sells water treatment and process chemicals and services.

Arthur D. Sciarnita was named vice president of IT at **Florida Power Corp.** Florida Power, in St. Petersburg, serves 1.3 million customers in central and northern Florida.

Ted Daniels was named head of the Computing and Communications Division at the U.S. Department of Energy's **Brookhaven National Laboratories** in Upton, N.Y. He has worked at Brookhaven since 1967.

Elizabeth "Libby" Chakravie, senior vice president of Bank of America's Internet Banking Division, was named chairman of The Internet Council. She will serve a two-year term.

Amelia "Amy" Courter was named vice president of MIS at **Valassis Communications, Inc.**, a sales promotion company in Livonia, Mich.

Roy D. Pex, former dean of Northwestern University's School of Education and Social Policy, has joined **SRI International** in Menlo Park, Calif., as director of the Policy Division's Center for Technology in Learning. The center works with edu-

cators to develop and adapt new computing technologies for use in education.

Fred Cornell was named senior vice president of IS at **Stein Roe & Farnham, Inc.** He previously worked at **Strong Capital Management, Inc.** Stein Roe is an investment management firm in Chicago.

Alan W. Anderson was named senior vice president, technical services, at **The American Institute of Certified Public Accountants**. Anderson will lead technical efforts for the 328,000-member accounting association.

Joan McKenna, vice president of payment technologies at **Visa International, Inc.**, was reelected president of the **Smart Card Forum**. The nonprofit organization promotes the use of multiple-application smart-card technology.

Kathie T. Schofield, senior vice president and CIO at **Farmers Insurance** in Los Angeles, was named the company's first executive vice president support services. Schofield will remain CIO and will manage human resources and plan for changes in the company's business processes.

David E. McDowell, former CIO at IBM, U.S., was named chairman and CEO at **Medaphis Corp.** in Atlanta. Medaphis provides transaction processing and client/server IT systems and services.

Buyer's Guide

THE HOLIDAY SPIRIT: Look, admit it. We're all in it for the toys. Here are a few of our favorites (and some duds) as reviewed by our staff. Full reviews at our Web site.

TIMEX DATALINK WATCH

When I first got Timex Corp.'s watch (www.timex.com), I really wasn't sure why I would want to use it. But after I had the \$130 watch in my office for a few days, it was clear to me that this is a timepiece to last after (15 people in our office wanted it badly). The software was fun, and easy to install and use—you can choose your watch sounds, among other things. And when you point the watch at the flashing bars of light on your PC monitor, your cubic-mates will thank you're James Bond. —L.H.

DESTINATION BIG SCREEN PC

"Looks like a TV, acts like a PC," says *Gateway 2000*. (www.gateway.com) For \$2,999, you get a 133 MHz Pentium processor, a 31-in. monitor, a wireless keyboard, 35M bytes of RAM, a 2.5G-byte hard drive, a 33.6K bps/sec. fax modem, eight-speed CD-ROM drive and more. —C.G.

MVNET-E CAMERA

This live videocamera/World Wide Web server/broadcast station from Active Imaging, Inc. (www.activemaging.com) does everything but baby-sit your kids—wait, it can baby-sit your kids! The \$4,400 camera has its own Web server, which allows a Windows 95 user to configure multiple output ports for several devices. —J.B.

FAX VIEW

Reflection Technology, Inc.'s (www.reflection.com) personal fax viewer has all the trappings of a Maxwell Smart/Agent 86 spy toy. The stylishly designed \$349 Fax View slips right into your coat pocket. It can receive, send and store faxes until you have time to view them. —S.D.

MONTY PYTHON & THE QUEST FOR THE HOLY GRAIL

Loaded with toilet humor and punctuated by graphic violence, *Yeh Luvet, Inc.'s* (www.theadvent.com) game is about as logical as killer rabbits, coconut shells that appear in 10th century England, and knights who say "NI!" and demand a shrubbery. In other words, the \$49.99 *Monty Python CD-ROM* is good for a few hours of laughs, but only if you liked the 1974 movie and still smirk if you hear a co-worker chomp, "I'm not dead yet." —J.C.

STUFF

CYBERGLOVE

CyberGlove from Virtual Technologies, Inc., in Palo Alto, Calif., has 18 sensors that provide touch sensations to your palm and each of your fingers. Programmable tactile feedback reportedly simulates contact between your virtual hand and the virtual world. **Pricing varies.** — C.G.

LOGICODE QUICKTEL II-C FAX/MODEM

Logicode Technology, Inc.'s **\$369.99** product wears many hats (www.logicode.com). Through Windows and Windows 95, it acts as a data modem (up to 33.6K bit/sec.), as a fax modem. With the bundled Quick Link Message Center software, this device works as a speakerphone and provides personal voice mail. — T.L.

NV-100 COMPACT NIGHT VISION SCOPE

I always wanted a night vision scope after seeing them in espionage movies. But after an hour of playing with Night Vision Scope from San Diego-based Moonlight Products, I found myself asking, "What the hell would I use this for?" Who really cares — this is cool and now affordable at **\$399**. Besides, you can justify it to your boss; tell him it could help you make your way around those lights-out data centers. — K.B.

AT&T POCKETNET PHONE

The idea is ahead of the technology on this **\$500** phone. You can read relatively short E-mail messages and collect simple data feeds on AT&T Wireless Services, Inc.'s (www.attdata.com) product. But sending E-mail is v-e-r-y s-l-o-w. Imagine typing E-mail messages using the keypad on your telephone. — J.C.

WYNDMAIL

Wynd Communications Corp.'s (www.wynd.com) plug-and-play wireless connectivity product is limited to electronic mail and file transfers. They cost **\$149.99 per month** for unlimited messages, but these wireless modems miss the mark for required functionality. — T.L.

SEJIN WIRELESS KEYBOARD

As long as the infrared receiver with its 10-ft. cord is placed in an area with a direct line of sight to the panel on the keyboard, Sejin Electronics, Inc.'s (www.sejin.com) wireless keyboard works nearly flawlessly — and for **\$99**. — T.L.

COOL

By Tom Igoe

CONTINUED FROM PAGE 105

YOU DON'T KNOW JACK EXTRA LARGE

"You Don't Know Jack" (\$39.99) from Berkeley Systems, Inc. (www.berkelys.com) is a pleasant enough time-waster of a CD-ROM quiz game. The trivia categories are probably the funnest thing about this title, including Dairy Treats, Digestive Tracts and World Demographics. But Trivial Pursuit this ain't. — S.D.

SOUND BAR

If you prefer to say what you think instead of writing it, Midsoft Corp. (www.midsoft.com) Sound Bar provides an audio mail system. (\$29.95) — J.B.

TIMELAPSE

In GTE Entertainment's (www.gte.com) complex game, players explore three ancient worlds and follow clues to solve a mystery. The \$49.99 CD-ROM can end differently each time you play if you ever get to the end. — T.O.

PYTH

Pyth is for every sucker who couldn't find his way off \$4 @ \$4 @ \$15 Myst island. Pyth, from Penny Interactive (www.pyth.com), spoofs the popular game Myst by showing the fallout of what a million part-up visitors can do to a cryptic tourist trap. The previous disk is now a graffiti-ridden sewer. Players travel through to interactive postcards with hilarious video clips and sound bites. What's best about Pyth (\$15)? You'll actually finish it. — K.B.

CASIO QV-10KA

If you want a quick, relatively low-cost (\$499) introduction to digital photography and don't especially care about picture quality, then this is the camera for you. Weighing in at only 7 ounces, the Casio, Inc. (www.casio-usa.com) QV-10KA is no bigger than most pocket 35mm cameras, yet the bright 1.8-in. color LCD screen gives you instant feedback on any of the 64 photos you can fit onto its flash memory. — P.G.

NINTENDO 64

You may need your motion-sickness pills before you dive into this high-powered descendant of the blockbuster Super Nintendo Entertainment System. But once you get accustomed to the hypercharged graphics, you'll never want to go back. The radically redesigned game controllers are more ergonomically friendly, and stereo sound definitely rules. The downside is a dearth of available software, but this \$199.99 game machine from Nintendo of America, Inc. (www.nintendo.com) is bound to be so popular that this won't be a problem for long. This is the interface of the future we're talking about here. — P.G.

SPECTRUM RINGMOUSE

The \$99 RingMouse mouse from Kante, Inc. (www.kante-spectrum.com) was easy to install, and the ring is comfortable and easy to click. But I couldn't aim the thing to save a life, which makes it very difficult to do real work. — L.H.

800-545-EXPO

See ComNet on the WWW:

<http://www.mha.com/comnet/>**ComNet's Exhibit Floor:*****The Complete Picture of the Global Enterprise Network***

The ComNet '97 exposition will feature more than 500 of the world's leading telecommunications and networking vendors, offering the latest in voice, data, and video communications, hardware, software, and services. It's an unequalled opportunity to explore hot new products and companies first-hand and get answers to your questions from the vendors themselves.

Get your hands on new tools and technologies at the beginning of the year. Test-drive the products you've been hearing about to see how they'll work in your organization. Meet the leaders and innovators of the latest enterprise networking advances. This is your chance to ask questions, get technical advice, and solve your toughest problems on the spot. Put the power of the ComNet exhibit floor to work for you!

ComNet's Conference Program:***A Non-Stop Learning Experience***

ComNet's conference tracks will arm you with an invaluable fortress of insights, updates, and guidelines on enterprise network technologies and techniques. Plus you'll get a collection of tips, shortcuts, and cost-saving techniques never found in manuals that will save you time, optimize your network, and squeeze absolutely the most power and productivity out of today's technology (and your budget). You can create your own agenda from nine separate tracks:

- The New WAN
- Fast LANs and Switching
- Remote Access and Mobile Workers
- Network/Systems Management
- Internet/Intranet Issues
- Policy and Deregulation
- Federal Forums
- Technology Primers
- You-Asked-For-It!

SNAPPY

Snappy is an inexpensive way to bring images to your intranet pages. Play, Inc.'s (www.play.com) Snappy plugs in to the printer port of your PC and has easy-to-use editing software. It only captures single-image frames. But for \$200, you can't complain. — J.B.

WIZZARD PINBALL CONTROLLER

ThrustMaster, Inc.'s (www.thrustmaster.com) package entertained me a lot longer than I'm sure my editor wanted, and there's no way to pretend you're working. The \$9.95 package is DOS-based so you can't Alt-Tab to your spreadsheet — and even if you could, how do you explain those blueappers mounted to your keyboard? — K.B.

NEWS CATCHER/AIRMEDIA LIVE

Why is it shaped like a pyramid? One marketing manager says, "It looks cool!" AirMedia provides the information feed via a pager-style broadcast network. Global Village Communications, Inc. (www.globalvillage.com) provides the News Catcher, the pyramid-shaped desktop receiver. The receiver and one year of basic service cost \$149 (\$24.95 per year thereafter). — J.C.

LIL' WOODY!

"Lil' Woody," stylish mouse or insult to marhoo? Both, actually, but it's the mouse we're talking about here. Bothell, Wash.-based Boom Enterprises' mice (\$79.99 each) are handcrafted from a variety of exotic hardwoods and function as typical two-button mice. They're perfect for a home office or to accent a mahogany desk, but on typical office furniture like my muted gray desk — sorry — K.B.

VIRTUAL I-GLASSES!

Once you get your bearings, this product (\$399 for video games and \$499 for computers) offers substantial entertainment — if you're into escapism. Not being video game connoisseurs ourselves, we rarely know what we were doing, which resulted in some random shootings and untimely deaths. But we got lured in by the bass-driven music, the imagery and the effects of our head movements and keyboard maneuvers. The IS angle for the Virtual I.O., Inc. (www.vio.com) headset? You look like a technogeek, so you might be able to convince your boss you're doing some cutting-edge work. — A.M. and C.C.

VIRTUAL VEHICLE JD

Designed by computer and racing enthusiasts, this \$1,295 Virtual Vehicle simulator from Interactive I/O, Inc. (www.interactio.com) immerses the user in the fast-moving world of interactive computer games. The IS angle: I just dare you to get your boss to sign off on this one. — C.C.

CARDSCAN PLUS 300

This is a keeper. Within 15 minutes, 75 business cards stacked on my desk were passed through Covec Technology Corp.'s (www.cardscan.com) 5- by 6-in. scanner. A click of the OK button, and the optical character recognition software went to work while I went to lunch. The scanner costs \$299 — K.B.

PHANTOM HAPTIC INTERFACE

Sensable Technologies, Inc.'s (www.sensable.com) Phantom Haptic Interface (\$17,000 to \$70,000) and Ghost software (\$500 to \$1,000) incorporate touch in the human/computer interaction. Beware: Your brain is tricked into thinking it's actually performing brain surgery, carving into clay or moving heavy geometric objects, which may result in "simulation sickness." — A.M., C.C.

PENCORDER 60

"Mommy, Mommy, that man's talking to his pen."
"Don't worry, dear, he's probably just a Computerworld editor."

Machina, Inc.'s (www.machina.com) Pencorder 60 is a somewhat oversized ballpoint with a gemstick. Press a button, and you can record a reminder to pick up milk on the way home and dictate a brief note about your just-concluded meeting. Press another button, and play back your memo. You can record several memos, but the recording quality isn't great. Oh yes, priced at \$70, the pen works just fine. — J.C.

TITANIC

When playing the Titanic (\$39.99), you are a British secret agent on a mission that never was completely understood by Computerworld game players. We played about three hours, and according to game documentation, we could have spent up to 27 hours more on the Titanic from Cyberbit, Inc. (www.mnqte.com). — C.G., A.M., K.B.

PENTAX POCKETJET

Toss up. There are occasions when you really do wish you had a printer right there in the hotel room. The 10-in. by 2-in. \$449 PocketJet from Pentax Technologies Corp. (www.pentaxtech.com) may be just what you need. It's good for basic printing for tasks such as sales proposals. — J.C.

The cool games and gadgets in this Buyer's Guide were reviewed by the following Computerworld staff: Jon Brunsell, Kevin Burdon, Jim Connolly, Stewart Duck, Cathy Cognate, Paul Gillin, Laura Hunt, Tom Lammiman, Amy Moley and Tim Ouellette.

IT Careers

MAINFRAME MISFORTUNES

THEY'RE THE LEGACY SKILLS NOBODY WANTS TO LEARN, AND THAT'S CREATING A GAP BETWEEN SUPPLY AND DEMAND

By William Spain

DB2: NOT FOR THIS GENERATION, THANK YOU!

Call it "the graying of the mainframe." As the big systems of yesterday get older, they increasingly are relying on the same core of skilled people who grew up with them. And as many in that group redirect their attention to newer technologies, fewer people are learning the skills necessary to replace them, leading to a talent crunch.

"Younger people see the DB2 mainframe systems as archaic and old-world. When you think DB2, you think big iron. That may not be the case anymore, but that's the reputation," says Eric Warner, chief operations officer at Greenbrier & Russell, Inc., a consultancy in Schaumburg, Ill.

In addition, many people who spent a lot of time learning mainframe skills when those skills were hot are no longer available, Warner says. In an attempt to keep current in technology and pay scale, "a lot of them have been converted over to client/server, and they don't really want to go back," he says.

The relative dearth of new DB2 talent coming up through the ranks — and the defection of some old-line managers — might not be a big problem for information systems employers if the technology were being widely scrapped. But as Warner points out, the number of requirements hasn't dropped significantly over the past few years. Adding to the problem, he says, is that "in general, people are on board paying more for client/server. They haven't admitted they need to pay more for [mainframe skills]." However, with the steady drop in supply of skilled DB2 people, he says, "they are going to have to pay more once they start feeling the pain."

Complete Business Solutions, Inc. (CBSI) is another company having a hard time filling its DB2 needs, according to Harisappa Venugopal, director of human resources at the consulting and training firm in Farmington Hills, Mich. "We used to talk about getting quality vs. quantity, [but] you don't even have the quantity these days. Everyone is all tied up with the client/server hype."

Everyone, that is, with the possible exception of CBSI's customer base, along

with hundreds of other large IS employers in a variety of industries.

Particularly hot for DB2 right now, Venugopal says, are manufacturing, retail and "of course, insurance and financial services are all still mainframe- and DB2-based."

"Corporate America has invested so much money in DB2 that until such time that client/server is providing the security and stability — the comfort level they need — the demand is going to remain for some time — another 20 to 30 years at least," Venugopal said.

MVS: A HOT SKILL GETS THE COLD SHOULDER

For some IS shops, the big problem may be finding people conversant enough in the latest and greatest technologies to meet developing information challenges. In at least one industry — financial services — getting sufficient personnel to maintain those monster mainframes is growing more difficult by the day. And no skill set is more in demand than MVS.

The problem is similar to that experienced by DB2 outfits: not enough new people. As Mike Puley, a technical recruiter at Principal Financial Group in Des Moines, Iowa, explains, "Everyone wants to get into client/server. They see [MVS] as older, and they are afraid they will get pigeonholed or left behind." Although there may be some validity to that fear, Puley points out that "mainframes aren't going away anytime soon. It runs the core of our business. We are gradually moving into client/server, but it's going to be a number of years before we leave mainframes behind — if ever. There is just so much time and money already invested, it will take a tremendous effort."

Principal Financial is far from meeting all its MVS needs, Puley says. That is leading to frequent increases in pay scales. In addition, headhunters are becoming an ever-increasing problem. "We are raided here all the time. It's an ongoing battle from both sides. We are constantly looking for things to keep and attract the good, strong candidates."

The shortage is so dire that even potential poachers often walk away with an

empty sack.

"The demand for applications programmers that know MVS is very strong right now. There is an acute shortage. I have hundreds of openings," says Richard Wonder, president of Richard Wonder & Associates, a recruiter in New York.

The reasons, for that, Wonder says, are threefold. "Most programmers don't want to work on these systems anymore. Everyone is starting to get very paranoid and upset about the year 2000. Colleges aren't even teaching it anymore." At the same time, he says, "With all the talk about client/server, they are still shipping more mainframes than ever."

Wonder says the current MVS candidate pool is largely made up of older U.S. programmers and talent recruited from overseas, mostly from Asia. And there just aren't enough of either, leading to increasing compensation levels for those with MVS skills, he says. "You find me a good mainframe application developer who is articulate, [and] I can get him \$60,000."

REGIONAL SCOPE

Southern Florida, the Caribbean and Hawaii

SPOTS

IS pros can easily be blind to job realities in vacation meccas. There are jobs to be had, but tourists aren't always welcome.

By William Spain

Although bright, sunlight may not be compatible with the stereotype of the pale information systems professional trapped in a windowless cubicle day after day, people use computers in warmer climates, too. So if you're someone who would rather skip across sand than trudge through slush after a week of hammering out code, there are several places where you can do that.

SOUTHERN FLORIDA

This area is definitely not the "Sleepy South." The economy is robust and diversified, and the population is growing fast — factors that lead to a strong market for IS professionals, employers say.

"We have a demand for skills across the whole IS spectrum," says Robert Tabb, vice president of IS at Miami-based transportation giant Ryder System, Inc. "We need network specialists, experienced [database administrator] types and [people] who have an understanding of client/server."

Topping Tabb's wish list are "strong client/server development skills, relational database specialists and network support and configuration people." Ryder, he says, is having a difficult time meeting its IS needs.

Tabb says one of the problems is that, with a few exceptions, Southern Florida businesses tend to be smaller than elsewhere. "There are lots of very small shops... It's not really a mecca for technical people, and you don't have a big talent pool" as a result.

M. Lewis Temares, vice president, chief information officer and dean of the College of Engineering at the University of Miami, agrees that local IS departments are going begging for a wide variety of skills.

"It's a good economy. There are more

jobs even than there are people to train for them. I have more [IS] management jobs than resumes," he says.

Particularly hot in the market, Temares says, are networking skills, software engineering, Oracle Corp. and PeopleSoft, Inc. skills.

THE CARIBBEAN

People who look for work in the emerging economies of the Caribbean basin had better have a variety of skill sets, says Enrique J. Lopez, president of AKI Group, Inc., an information technology consulting firm in Coral Gables, Fla.

"Basically, what you are finding in the Caribbean is a great need for jack-of-all-trades," says Lopez, whose firm does about half its business in the region.

That shouldn't be surprising. After all, Lopez says, this is a "confusing mish-mash" of cultures, countries and business climates. The economies of the region range from the well-developed, such as Barbados and Puerto Rico, to the rudimentary and often impoverished, such as Haiti and the Dominican Republic.

The language of business also varies. Spanish, English and French are all spoken in the area.

And virtually all the nations of the region need at least some outside help to develop their information infrastructures. But because of issues of "nationalism and culture," Lopez says, full-time permanent staff positions are few and far between.

American IS personnel, Lopez says, "most likely will be accepted as consultants. They will be welcomed but very limited in terms of opportunities."

Jorge Fratt, senior vice president and

director of IT at Martí, Flores, Prieto & Wachel, an advertising agency in San Juan, Puerto Rico, says IS needs in his market include networking and Internet skills, along with Sybase, Inc., Informix Corp., PowerSoft Corp.'s PowerBuilder and Oracle skills. Industries that are hiring on the island include banking, manufacturing and communications. However, he adds, "We have a very good offering of local people."

HAWAII

In theory, an IS person who wants to relocate to Hawaii should face none of the cultural barriers found in the Caribbean or other foreign markets. And in practice, the 49th state has many of the same IS needs as the rest of the country.

But "what we are looking for are people who are willing to live here" and not just pop over for a year or two, says Thomas Wrenn, manager of information services at Hawaiian Electric Co.

Hawaii offers a lot of advantages, such as "a relaxed atmosphere, the sun and year-round water sports," Wrenn says. But he cautions that mainlanders will have to adjust to "a much smaller community and a high cost of living. And we don't pay the real high salaries."

That said, "there's always a need for fresh talent for people who make things happen," Wrenn says. That applies to a variety of disciplines. "Today, more and more, we are looking for well-rounded people, not just superexperts. Because of the small size of our companies, an Internet specialist has to be a LAN and database specialist all rolled into one."

Spain is a freelance writer in Chicago.

Bring your skills to our table.

At Darden Restaurants, Inc., the parent company of Red Lobster and The Olive Garden, we know that to attract the best professionals, we have to offer the best opportunities. We are not just one of the most sophisticated and technologically advanced companies in the industry. We provide talented systems professionals with everything needed to fulfill their career to the fullest — and satisfy their hunger for a challenge. It's a reputation we've built as the world's largest casual-dinnerware organization. And it's a commitment that can take your career to a whole new level.

PROGRAMMER ANALYSTS Restaurant Systems Department Corporate Systems Department

Our Restaurant Systems Department maintains and enhances all computer systems at our more than 1,000 restaurants nationwide. We were the first in the restaurant industry to introduce a computerized point-of-purchase system. Currently, we utilize COBOL and C++/Windows/Unix, and are migrating to a Windows NT platform. As the restaurant systems department and leader in future plans include rewriting the application with Visual Basic interface. C++ applications logic and a relational database.

Our Corporate Systems Department develops applications that enable our business units to operate more efficiently and profitably. Working in small development teams, our Corporate Systems Department develops all MAINFRAME and C/IBM SYSTEMS platforms. We develop applications using COBOL, Visual Basic, and Visual C++ for various systems, Lotus Notes, and IBM AS/400 as well as VSAM files.

All positions are based at our corporate headquarters in Orlando, Florida. For consideration, please send a resume to: S. D. Lock, Darden Restaurants Inc., Dept. CWRP-RS for Restaurant Systems Department or CWRP-CS for Corporate Systems Department, P.O. Box 20330, Orlando, FL 32816-0330. Fax: 407-345-5504. Internet: DCRPSR@worldnet.att.net or DCRPSR@att.net. When responding, use as an address, please use Microsoft Word 6.0 format.

At Darden Restaurants/Red Lobster/The Olive Garden we appreciate the strength of a diverse work force and equal opportunity employment opportunities for all EOE.

The Environment Here Is Hot!

Hot in the sense of new... exciting... leading edge. And hot in the sense of temperate temperatures... balmy breezes... and warm Gulf waters. Now you can have it all when you join Tropicana Products, Inc. in lovely Bradenton, Florida.

As the world's leading brand of orange juice, we have held onto our uncompromising commitment to quality for the past 50 years. But only in our products, not in our people and our environment. Which is why we now seek high-caliber candidates to lead our IT Department in migrating towards a state-of-the-art client/server environment. Open positions include:

NETWORK SPECIALIST

You'll install and troubleshoot networks, act as liaison with vendor field service, configure and support network management, and assist with telecommunications projects. We require experience with configuring and implementing client-server-based networks, plus network management hardware and software. Knowledge of TCP/IP, IPX, DECNET, Bany VLM, DEC/VAX, NT, and/or Novell is a must, as is a college degree.

E-MAIL ADMINISTRATOR

We'll rely on you to set up and maintain our E-mail system. You'll need 2 years experience with Outlook, Exchange, Outlook Administrative Utilities, Outlook Link to SMT, Lotus Organizer, Windows 3.x, and the Internet/Intranet. A degree is required.

DATABASE ADMINISTRATOR

Duties include advising on the choice of ORACLE, Reliance, pricing project and application standards, and overseeing the strategic direction of our database administration. A strong background in Oracle, Unidata, data distribution, application development, capacity planning, and logical data models is essential, along with a BS in Computer Science.

SPECIALIST - TEST ADMINISTRATOR

You'll establish a client/server model testing process and oversee all testing efforts based on application requirements. We require 5+ years' experience developing projects as a test administrator and 2-3 years' experience in client/server model testing; knowledge of SQL, Test Suite and TEF a plus, along with UNIX and ORACLE environments.

ANALYST

In order to support our EDI system with analysis and programming, you must have 3-5 years' experience in programming and 1-2 years in systems analysis. Specific experience in IBM mainframe, VAX, dec/dec/dec, VMS, ORACLE, and RDB, TCP/IP, SNA, LAN, APPC, DECNET, SDC and COROL is mandatory, as is familiarity with IBM mainframes X12, UCS, and WWS. A degree in Computer Science, Business, or MIS is required.

DATA WAREHOUSE INTEGRATOR

We'll rely on you to implement ESS/SS/DSware warehouse and help transform our existing data sources into a single source solution. Experience with ESS/SS/DS/OLAP technologies, open system platforms, online tools, and both logical and physical data models is a must. A BS in Computer Science is also required.

INTEGRATOR (TECHNICAL ARCHITECTURE)

You'll perform technical architecture integration across multiple projects and applications. Requirements include related experience and knowledge of IBM systems, NT, UNIX, OS/2, C++, or JAVA. A BS in Computer Science is required.

We offer a highly competitive compensation package, clear avenues for your career plans, and all the pleasures that accompany our enviable location. To apply, please send resume with salary requirements to: Tropicana Products, Inc., Attn: CH-600, P.O. Box 258, Bradenton, FL 34202. Equal Opportunity Employer.

For Peritus, Year 2000 is just the beginning...

Peritus Software Service, Inc. is a rapidly growing, privately held company with the #1 national Year 2000 conversion technology license for most of the major software providers. Our client base and impressive customer list are evidence that Peritus is a key player in the Year 2000 marketplace. Further yet, the application of our technology stands well beyond Year 2000 by setting the standard for maintaining software in the new millennium.

Peritus is maintaining successful software tools for over 20 different types of software, software test generation, and more change management. This is your opportunity to work with leading edge technologies including Cobol/Assembler, C++, Java and Delphi. Our openings require a BS/MS, 3+ years' experience and the following:

TECHNICAL CONSULTANTS:

COBOL/Assembler, C++ and Java: MS, MS/DO, DB2, Java, Visual Basic, etc.

NETWORKS/SYSTEMS ADMINISTRATOR:

COBOL, Assembler, C++, Java, Visual Basic, etc. TCP/IP networking, AIX, NetWare, and scripting. Perl, sed, etc. MS/DO, C++ and DB2/MS/DO.

SOFTWARE ENGINEERS:

C++, Java, Visual Basic, etc. MS, MS/DO, DB2, Java, Visual Basic, etc. TCP/IP networking, AIX, NetWare, and scripting. Perl, sed, etc. MS/DO, C++ and DB2/MS/DO.

Other opportunities in Atlanta, MA include:

• Project Leaders

• Marketing Specialist

• Sales

Respond with resume to: Human Resources, Dept. CW, 200 General Road, Shirley, MA 01901-3465. Fax: (508) 878-1173, e-mail: resumes@peritus.com. Home page: www.peritus.com. We are an Equal Opportunity/Affirmative Action Employer.

Auburn University Chief Information Officer

DUTIES

The Chief Information Officer (CIO) is a newly created position reporting to the President. The CIO is responsible for providing technical, business, planning and coordination of information technology and information resources to the university. The CIO works closely with central and campus based information technology professionals to develop strategy and plan for information technology services and infrastructure throughout the university. The CIO directly manages central information technology staff who are responsible for university wide technology and telecommunications, and user support applications. The CIO also coordinates distributed computing within the university. This position's responsibilities also include: academic, administrative functions, and distance learning services.

QUALIFICATIONS

Candidates must have broad information technology knowledge and management skills with a minimum of eight years of increasing management responsibility that includes experience in a major information technology organization. Other qualifications include a master's degree, superior ability to make technical issues understandable and an ability to teach technical concepts to university personnel. Proven skills in staff management, planning, delivery and ability to build consensus are essential. Preferred skills include experience in information technology in higher education, experience in applying quality management, an advanced degree and relevant experience beyond the eight year minimum.

APPLICATION PROCESS

Screening of candidates will begin February 15, 1991 and will continue and the position is filled. The university plans to fill the position as of October 1, 1991. For further information visit www.auburn.edu/cio/

Send vita, resumes and applications to all three universities, and a letter of recommendation which includes the candidate's name, the title of information technology in higher education, and list personnel of the candidate's last ground and experience with the position of Chief Information Officer for

TECHNOLOGY MARCH

WEB MERCHANDISING TOOLS SPINNING OFF

By Debra A. Velonis

MORE COMPANIES are selling products and services through the World Wide Web sites now that major vendors have introduced software packages for Web merchandising. An industry protocol that provides tight encryption for online credit-card transactions, Secure Electronic Transaction (SET), has also been developed in response to security concerns.

The software packages, commonly called merchant servers, provide an antiseptic environment for merchandising and accepting orders online.

Vendors that offer these products include some well-known names. Microsoft Corp. has Merchant Server v3.0, IBM has Net.Commerce and Netscape Communications Corp. has an Electronic Commerce Platform and its SuiteSpot and Commerce Extensions products. Other vendors to watch include Connect, Inc., with OneServer and OrderStream; Broadvision, Inc. with One-to-One WebApps; and iCat Corp. with its Electronic Commerce Suite, which consists of iCat Commerce Publisher and iCat Commerce Exchange. Meanwhile, Oracle Corp. has previewed its Project Apollo. A full release is planned for the first quarter of next year.

You could place bets on well-known

vendors such as Microsoft or Netscape to gain the largest market share, but most analysts agree that it's too soon to tell who will come out on top.

STEPS TO TAKE

Analysts say an important first step for

any company embarking on Web merchandising is to evaluate its goals and what it wants to accomplish from this form of merchandising.

"We recommend that people look carefully at their own strategy, how aggressive they want to be in their market, how aggressive they want to be on the Internet, in terms of defining the Internet channel, for their business," says Stan Dollberg, director of the software strategy service at Forrester Research, Inc. in Cambridge, Mass.

Companies must also decide how much they want to invest in these packages. Prices for merchant server products vary. For example, iCat's package costs \$14,995 per single-user version. Microsoft's product costs \$18,490 for a server license, and administration license and Connect's OneServer costs \$100,000 per server.

A company must also look ahead to what kind of results it expects from Web merchandising. "You have to evaluate your budget and see what you really expect to happen," says Scott Smith, group director of the digital commerce group at Jupiter Communications in New York.

BEFORE SELLING ON THE WEB

- Think strategy. How aggressive should you be on the Internet?
- Decide on the investment to make
- Identify your online customer base
- Plan the appearance of your Web site
- Find software that ties in to your back office

A merchant server package needs to tie in to the back office, the company's existing infrastructure for selling products or services, says David Weisman, director of money and technology strategies at Forrester. It should integrate and fully automate order entry, shipping, delivery and customer service. It should also eliminate the need to rekey information.

Victor Wheatman, vice president of electronic commerce strategies at Garner Group, Inc. in San Jose, Calif.,

agrees. "Once companies set up a cyberstore or retail presence on the Web, are they going to be able to deal with the orders, or is each order going to be an exception?" he asks. "Are they going to be able to deal with customer service, or are there going to be problems?"

FEELING SECURE

Another issue is preventing credit-card numbers transmitted over the Internet from falling into the wrong hands. In response to security concerns and to provide one cohesive system for processing online credit-card payments, several industry players, including IBM, Microsoft and Netscape, worked with Visa International, Inc. and MasterCard International, Inc. to build SET. Its multistep security encrypts credit-card numbers so well that even merchants don't see them.

The groundwork has been laid for SET, but it hasn't been fully implemented. In the meantime, it's safe to say that no major software vendor is ignoring SET but rather incorporating SET compliance into their merchant server packages.

"Everyone's pledged allegiance to SET," Dollberg says. The protocol is "probably six to nine months away from reality in the marketplace," he says.

Velonis is a freelance writer in Huntington, N.Y.

PROCEED with CAUTION

More high-tech companies went public in 1996 than ever before.
But these companies can still be risky investments.

There was a bumper crop of high-tech initial public offerings (IPOs) this year, but you should still tread carefully when it comes to investing in these companies.

Many of them — particularly those in the Internet segment — just don't have a long enough track record to be a sure bet.

But, boy, are there plenty of investment opportunities to at least consider. With just a few weeks remaining this year, 196 high-technology companies have gone public in 1996, each with capitalization of at least \$50 million. This smashes last year's record of 164 high-tech IPOs.

Analysts say investors should be cautious when considering buying IPO shares. "Ideally, you want to look closely at financial statements for companies with a good product or good growth potential," says Ryan Jacob, director of research at IPO Value Monitor in New York.

NEW DRINKS

The Internet has made IPO investing trickier, agrees Mark Sherman, an analyst at Robertson, Stephens & Co. in San Francisco. "In the past, investors could get an accurate indication of how successful a software IPO would be based on how well the company met established criteria," he says.

With the Internet, investors have to carefully evaluate the soundness of companies' business plans and direction before plunging into an IPO investment, Sherman says.

So be careful on those choppy Internet start-up waters. Look for previous company success or innovative technology in a growing, but not overcrowded, Internet sector. Find companies with proven executives in leadership positions and a compelling product offering. It is wise, analysts say, to steer clear of unknown start-ups with amorphous "plans."

"You have to be crazy to go after anything that doesn't have an established track record," agrees Alan Newman, a market analyst at H. D. Bruns & Co. in Great Neck, N.Y.

So why all the IPO activity this year? In part, it was due to it being a presidential election year. Election years typically see more IPOs, Newman says, because the first year of a new presidency is when economic belt-tightening takes place.

"Companies have been desperate to get into the IPO pipeline this year," he adds.

Plus, there was a more adventurous spirit among investors earlier in the year.

"What we saw in the spring was investors willing to buy into concept stocks," Jacob says.

"Investors were willing to gamble a little bit on companies still in the development stage" without an earnings track record.

Early this year, investors seemed especially hungry for anything Internet-related — quickly snapping up stock offerings from Internet search engine companies such as Excite, Inc. (Nasdaq: XCTI) and Yahoo, Inc. (Nasdaq: YHOO).

Now, however, the fever has cooled. Take a look at the Infoseek Corp. (Nasdaq: SEEK) chart at left. The company waited until June to issue its IPO, and investors' enthusiasm has been only lukewarm. That's because investors have become a bit more selective, Jacob says. "It has evidently become more important to investors for a company to have earnings or the potential for earnings in the near future."

Two areas where public offerings have carried over into strong stock performance have been software and networking consulting. In particular, the year 2000 problem has been a launching pad for a number of IPOs, such as Data Dimensions, Inc. (Nasdaq:DDIM) and Information Management Resources, Inc. (Nasdaq:IMRS).

INDUSTRY ALMANAC

One year later

A year ago, *Computerworld* issued several Wall Street analysts to look ahead into 1996 and pontificate about which technology stocks they thought would have an "interesting" year. We didn't ask for their top picks or their favorites for '96. We just wanted to hear what high-tech stocks the analysts' thought would be interesting to follow.

Jim Wade, an analyst at Altm. Brown & Sons, Inc. in Rahmerville, last year said internetworking companies Cisco Systems, Inc. (Palo Alto: CSCO) and Bay Networks, Inc. (Hawthorne: BAY) were poised to benefit from the Internet's need for increased capacity. Both companies had an interesting year, but in different directions last year.

Nate Zelnick, most recently an analyst at Mucklermedia Corp., picked two big winners with Intel Corp. (Nasdaq: INTC) and Cascade Communications Corp. (Nasdaq: CCCC). Adam Schoenfeld at Jupiter Communications, Inc. in New York foresaw an interesting year for PSINet, Inc. (Nasdaq: PSIX) and Chacefire Corp. (Nasdaq: CFFR).

Al Goldman, an analyst at A. G. Edwards in St. Louis, stepped outside the Internet and offered up Sybase, Inc. (Nasdaq: SYBS), Applied Materials, Inc. (Nasdaq: AMAT) and General Computer Corp. (Nasdaq: GCR).

Some companies were mentioned by several analysts. Apple Computer, Inc. (Nasdaq: AAPL), Digital Equipment Corp. (NYSE: DEC) and Microsoft Corp. (Nasdaq: MSFT) all bore watching, according to our panel. — Stewart Dack

AND WHAT A YEAR IT WAS!

Our panel of analysts predicted the following technology stocks would have an interesting 1996:

	1/2/96	4/2/96	8/1/96	12/2/96
Apple	25%	25%	25%	25%
Bay Networks	29%	27%	27%	27%
Cascade	43%	74%	74%	74%
Chacefree	17%	16%	16%	16%
Cisco	47%	68%	68%	68%
Digital	54%	40%	40%	40%
Intel	37%	127%	127%	127%
PSinet	9%	13%	13%	13%
Microsoft	51%	78%	78%	78%
Security Dynamics	25%	42%	42%	42%

COMMENTARY

The security biz: Good work if you can get it

David Coursey

Call me paranoid, but I've always had a deep-seated suspicion that the people who write computer viruses are the same people who write the antivirus software that protects us from the people who write computer viruses. Or vice versa.

Perhaps the two sides, if not the same people, are close, personal friends. And the IS departments that spend big bucks on antivirus software are essentially innocent bystanders, caught in the middle of a game being played by others. Spy vs. Spy, writ large.

I mention this so you'll understand that I think security is a game — the good guys struggle to stay one step ahead of the bad guys and never quite succeed.

On top of this, computer security is a black art to most people, myself included.

Even if you understand how TCP/IP works, securing your site requires that you be smarter than people who understand TCP/IP and want to ruin your day.

Security purchases, whether antivirus

software or an expensive Internet firewall, are made out of fear. And vendors do their best to keep IS somewhere between very concerned and very afraid.

Those vendors also don't want you to know what they're up to, lest the bad guys learn their tricks. Or so they say, although much of what they do seems to qualify as common sense.

Knowledge is power, however, and the firewall companies are security consultants who turn this knowledge into cash.

Sound like a bit of a scam? Well, W. C.

Fields would be right at home in the computer security business.

Vendors and consultants deal a poker hand in which only they know the cards. All the customers know is that they'd better not lose. At the end of the game, IS has been strong alone — never quite losing but not winning, either — and the dealer has almost all the chips.

So do what you can, but make no mistake: Most companies will never be able

to spend enough money or develop the right skill set to protect their network from a concerted attack by a motivated attacker.

Sure, you may be able to persuade a joyrider to rust somebody else, but if the professionals want you, they can find a way. All you can do is raise the ante.

Corporate customers face another terrible choice: You can have an open, easy-to-use network or you can have a secure network, but you can't really have both. Every move toward security requires a

move away from user friendliness, at least for some of your users. That will improve over time, but until security and traceability become priorities, the problems will only get worse.

Reaching international agreements that provide for the extradition of computer criminals — and then exercising them regularly — might help.

SAFETY FIRST

It's a sad comment on our world that high-grade security has to go in before, to quote the old TV commercial, "the name goes on." If the creators of cellular telephones had realized how easy it would be for thieves to clone phones, they might have done things differently.

Likewise, the Internet was created through a series of formal and informal agreements — mostly of goodwill. The Internet wasn't designed to be very secure, and now we're paying the price — in the millions.

Coursey is a consultant, analyst and editor/publisher of Computerworld.com, an electronic newsletter at www.cw.com. His Internet address is david@coursey.com.

Taking the long view on IS expertise

Charles Babcock

I recently spoke to a group of Silicon Valley technical recruiters and told them they'd soon be looking for laid-off Cobol programmers to help deal with the year 2000 problem. When you find them, I predicted, they'll come back — but with "an attitude." This line drew a laugh, which surprised me.

It's always been obvious to me that Cobol programmers represented the competence of an earlier age. They might be out of fashion, but that is different from being hopelessly out of step.

They were systems people who understood their businesses. They knew what data meant in relation to business processes. Then, in the name of business process re-engineering, they were downsized.

Now their former companies want them back. In my opinion, many of them never should have been laid off. The recruiters understood instantly. They told me they struggle with a demand for technical staff that now exceeds supply.

Oracle needs 100 new people each month and has for so long that it's be-

come routine. Hewlett-Packard representatives said they struggle to find more

than 1,000 people each month, which raises a larger issue for organizations everywhere.

How do you retain good staffers, even if they are a bit long-in-the-tooth, when the needs of your company change?

Some individuals adapt on their own. Scratch five of your client/server experts, and at least one will turn out to be a former Cobol programmer. Tap your intranet builders, and you're likely to find former client/server staff.

But organizations shouldn't rely solely on spot initiative to manage these migrations. We must start to view successive waves of technology as evolutionary, not revolutionary. A great deal of what was learned in an earlier era remains pertinent in a new context.

In the midst of the PC revolution, the IBM mainframe continued to grow in processing power, and by the way, those mainframes know how to back up and recover systems.

It's a matter of breadth vs. the ability to get things done.

So, if you're feeling hammered by Michael Hammer, author of *Re-engineering the Corporation*, you might think about ways to get to a leaner, flatter organization than issuing a bunch of pink slips.

People who share technical skills often share hidden channels of communication.

They share unspoken understandings about how the company works and insights into what data is needed for a new system. Those qualities are needed in adopting new technologies.

These forms of communication don't take place by executive fiat after a bout of re-engineering, especially when the people sitting next to each other are all new.

When Visa International wanted to get an early jump on its year 2000 problem, it relied on in-house staffers more than outside consultants. I've seen the example repeated by managers building data warehouse applications and other new systems.

If you want to do more with less, how about doing more with the expertise you've already got? If the people aren't thinking creatively, find a spark plug within their ranks that you can elevate. Any group will think more creatively if its members aren't engaged in reapplying for their jobs.

Re-engineering doesn't have to get ruled out. But it should be part of an approach that capitalizes on core competencies and existing knowledge, translated into new systems.

If your existing people generate more revenue, you have a de facto lever (though probably not a silver bullet) organization — one that could do it again.

Babcock is Computerworld's technical editor. His Internet address is charles.babcock@cw.com.

Patent watch

Recently found U.S. patents
(plus numbers, names
and company, date issued)

Programmable robot system that guides the blade of a surgical saw but drills so it can make precise cuts for holes in bones during orthopedic surgery. The device can be used in total knee reconstruction for "aligning a plate, screw, nail or prosthesis to bone" (5,573,110, University of Washington, Nov. 5)

System for charging the batteries of electric vehicles. When drivers pull into a battery-charging station, an onboard computer and the station's computer co-processor negotiate about the battery, voltage and payment (5,572,209, Arluo I. Kottis, Nov. 5)

World Wide Web browser plugin that fills the time it takes a Web page to be downloaded by showing an advertisement, copyright notice, registration form, message or "junk" Web page. That was the waiting time to produce the first Web site and the current procedure (5,572,643, David H. Hudson, Nov. 5)

Source: Microsoft of patents (patent.com)

READY, AIM, DRAW

Thought it was hard to draw with an

Etch-a-Sketch? It's even harder to do

on the World Wide Web, where Web-a-

Sketch resides (www.digitalsketch.com/

web-a-sketch/). The same rules apply:

Entire drawings are a continuous line,

and each line segment is permanent.

Unfortunately, you don't get to shake the Web version.

Stop squawking

Tired of noisy birds? Bloch, Inc. in Pittsburgh offers a PC-based "noise deterrent" that acts like a computerized water pistol. When the voice-recognition system hears a squawk, a water pump squirts water. Computerworld reader Andrew Borts saw the Stop Squawk ad in *Bird Talk* Magazine and wondered if it would work on squawking executives.

MICROSOFT SYSTEMS in Medford, N.J., has developed the world's first "noise deterrent" capable of squawking through a noisy window. The company can offer many services from a home-based office. The system is that. Therefore, the company has a bunch of glass. Possible users of the technology include car dealerships, real estate offices and banks. A starter kit costs \$395.

IF YOUR WEB SITE is ever mentioned in the national press, be prepared for the onslaught. The Library of Congress World Wide Web site was featured in a Sept. 23 *Parade* magazine article, and the servers were swamped with visitors that Sunday. The number of hits was six times higher than the previous Sunday.

Send your alt.cw contributions to altcw@cw.com. If you mean to send us a cool T-shirt

Inside Lines

We build power plants, airports and... date fields

That could be the motto for engineering and construction giant Bechtel Group Inc., as rumored, the company enters the fast-growing year 2000 market. Bechtel supposedly hopes that with its experience managing large, complex construction and engineering projects worldwide, it can do the same for less-disciplined information systems shops.

Sybase throttles back on database update

Sybase has started doing some hush-hush advance briefings about its upcoming update of its SQL Server 11 database, code-named Griffin. The release is expected to include parallel query support and other new features. But Sybase officials last week said users shouldn't count on seeing Griffin for a while. The company's developers are focusing on slapping together Unix versions of a database and other bundles for Windows NT that will be announced this week. The Unix bundles are expected in the first half of next year.

Building a bigger mailbox

Microsoft Exchange's 56K-byte limit on mail storage won't be expanded when Version 5.0 ships in the first quarter next year. But sources close to the company said Microsoft will ship a fix about 45 days later that expands the storage capacity to 16T bytes.

Bandwidth binds

Dozens of vendors seek to conserve precious bandwidth of the Internet and corporate intranets through an emerging network technology called IP Multicast, which slashes communication overhead by efficiently focusing mass-distribution messages. But proponents wound up contributing to the problem last week by banding an electronic-mail announcement about the IP Multicast Summit to be held Jan. 16 in Santa Clara, Calif. Everyone on the distribution list also received every error report and returned message from failed delivery attempts, plus the ensuing complaints from those on the list whose in-boxes were flooded. Better not let push come to shove — pull the information yourself from www.ipmulticast.com.

Story of 0

Outsourcing is still a spooky word in many IS shops, and that was no more evident than during a teleconference last week to announce Du Pont's \$4 billion, 10-year deal. Du Pont Chief Information Officer Cinda Hallama did everything possible to avoid using the "C" word and instead used terms such as "alliance" and "services." After several members of the press repeatedly described the Du Pont deal as an outsourcing contract, Computer Systems President and CEO Van R. Hoenes stepped in to say, "This is not outsourcing; this is a technical partnership." Whatever.

A few good traders

The Marines are convinced that the next battlefield is on the digital frontier. That's why "The Few, The Proud," joined forces with traders last week (Dec. 9) at the New York Mercantile Exchange for Traders III, the third installment in a series of war games and exercises that were designed to explore decision-making on the trading floor.

Just in time for the holidays, the folks at Thomas Investigative Publications can help you find something for those hard-to-shop-for Magnimar P.I. types. Cruise by www.punish.com, and check out the Menace Spy Camera (\$2), motion surveillance sunglasses (\$2) and invisible ink typewriter (\$30). You can also help them set up shop with P.I. software. The Lady's Luck's Raffle or (gasp) with a fake press card (\$5). But then, you certainly don't need a press card to send a news tip to news editor Patricia Keefe. Just call her at (351) 820-8183. Or send her e-mail at patricia_keefe@cw.com.

It looks real, but it's actually computer art enhanced by software from Lightscape Technologies in San Jose, Calif. Lightscape uses "radiosity" algorithms for ultrarealistic lighting effects.

That could be the motto for engineering and construction giant Bechtel Group Inc. In any event, the company entered the fast-growing year 2000 market. Bechtel supposedly hopes that with its experience managing large, complex construction and engineering projects worldwide, it can do the same for less-disciplined information systems.

Sybase fights back on database update

Sybase has started doing some head-to-head advance beatings about an upcoming update after SQL Server's database, code-named CofE. The database is expected to include parallel query support and other new features. But Sybase officials last week told users shouldn't count on seeing CofE for a while. The company's development is focused on shipping together Unix versions of a database and tools bundle for Windows NT that will be announced this week. The Unix bundle is expected in the first half of next year.

Building a bigger mailbox

Microsoft Exchange's 5.0-byte limit on mail storage won't be expanded when Version 5.0 ships in the first quarter next year. But sources close to the company said Microsoft will ship a fix about 45 days later that expands the storage capacity to 16T bytes.

Breakable Mail

Dozens of vendors rush to conserve precious bandwidth of the Internet and corporate networks through an emerging network technology called IP Multicast, which streamlines communications overhead by efficiently focusing mass-distribution messages. But proponents worried by contributing to the problem last week by bashing an alternative mail format about the IP Multicast Standard to be held Jan. 16 in Santa Clara, Calif. Everyone on the distribution list also received every error report and returned message from failed delivery attempts, plus the ensuing complaints from those on the list whose in-boxes were flooded. Better not let push come to shove — pull the information yourself from www.ipmulticast.com.

Story of O

Outsourcing is still a spiky word in many IT shops, and that was no more evident than during a teleconference last week to announce Du Pont's \$4 billion, 10-year deal. Du Pont Chief Information Officer Chris Hoffman did everything possible to avoid using the "O" word and instead used terms such as "alliance" and "services." After news and members of the press repeatedly demanded the deal stand on an outsourcing contract, Computer Sciences President and CEO Van S. Hooykamp stepped in to say, "This is not outsourcing; this is a technical partnership," Whitener.

A few good traders

The Madison are convinced that the most hotbedded is on the digital frontier. That's why "The Fox, The Prowl," joined forces with traders last week (Dec. 9) at the New York Mercantile Exchange for Predator II, the third installment in a series of war games and scenarios that were designed to explore decision-making on the trading floor.

Recently issued U.S. patents
(Patent number, inventor/assignee, date issued)

Programmable, robotic system that guides the blade of a surgical saw for (split) so it can make precise cuts (or holes) in bones during orthopedic surgery. The device can be used in total knee reconstruction for "affixing a plate, screw, nail or prosthesis to bone." (5,721,110, University of Washington, Nov. 5)

System for charging the batteries of electric vehicles. Wires deliver pull into a battery-charging station, an onboard computer and the station's computer swap information about the battery, voltage and payment. (5,573,105, Affle L. Keith, Nov. 5)

World Wide Web browser plug-in that fills the time it takes a Web page to download by showing an advertisement, copyright notice, registration form, message or "mini Webpage." That way, the waiting time is productive for the user and the content provider. (5,573,645, David H. Judson, Nov. 5)

READY, AIM, DRAW

Thought it was hard to draw with an Etch-a-Sketch? It's even harder to do on the World Wide Web, where Web-a-Sketch resides (www.digitalstuff.com/web-a-sketch/). The same rules apply: Entire drawings are a continuous line, and each line segment is permanent.

Unfortunately, you don't get to shake the Web version.

Stop squawking

Tired of noisy birds? Bloch, Inc. in Pittsburgh offers a PC-based "noise deterrent" that acts like a computerized water pistol. When the voice-recognition system hears a squawk, a water pump squirts water. Computerworld reader Andrew Borts saw the Stop Squawk ad in *Bird Talk Magazine* and wondered if it would work on squawking executives.

MICROBIAL SYSTEMS... Methuen... the world... capable of... a store window... companies can... services from a... doors. The ven... ThruGlass... touch through... inch of glass.

Possible users of the technology include car dealerships, real estate offices and banks. A starter kit costs \$995.

IF YOUR WEB site is ever mentioned in the national press, be prepared for the onslaught. The Library of Congress World Wide Web site was featured in a Sept. 29 *Parade* magazine article and the servers were swamped with routes that Sunday. The number of hits was six times higher than the previous Sunday.

Send your alt.cw contributions to altcw@cw.com. If your item is used, you'll receive a cool T-shirt.

Introducing the IBM S/390 Multiprise 2000. It's just as impressive for what it doesn't do.

The IBM S/390 Multiprise 2000[®] server looks like it does it all. But there are a few things it doesn't do. It doesn't take up much space, use lots of power or demand much time from your staff.

It also doesn't force you to buy loads of new software. The S/390 Multiprise server can handle just about whatever you're running now plus the latest UNIX[®] client/server and S/390 programs. Even corporatewide LAN data is a simple interface away. And Internet and intranet transitions are easy. So business can grow with the S/390 Multiprise family.

What's more, it doesn't consume all your resources. The S/390 Multiprise

saves up to 89% in floor space, 95% in energy costs and actually increases performance up to 40%.

And it's all ready to go with our Entry Server Offering (ESO) packages. Which give you hardware, software, services, maintenance and financing at significant savings.

The new S/390 Multiprise 2000. If you want to be even more impressed, stop by and visit www.s390.ibm.com or give us a call at 1 800 IBM-2168, ext. CA254.

With Speed at a Premium

INTRODUCING NETWORKS WITHOUT LIMITS.
MADE POSSIBLE BY WINDOWS NT
WORKSTATION AND KINGSTON MEMORY.

Unleashes
the power of
Windows NT[®] 4.0

If you want to take your network and business to a higher level, you need Microsoft[®] Windows NT[®] Workstation. Of course, an operating system that powerful should be fueled only by the finest memory: Kingston[®]. You'll see productivity go through the roof. People will be downloading vital information from the Internet. Running multiple 32-bit applications at light speed. And sending messages

and images back and forth across the planet. So, why Kingston memory? Kingston engineers use exactly the same specifications as system manufacturers, like DEC,[™] Compaq[®], HP[®] and IBM[®]. And they test every cell on every chip on every module. (On a 16 megabyte module, that's 128 million cells.) Besides, Kingston memory costs far less than the system manufacturers'. To find out more, call (800) 588-5359 today. And watch your network really take off.
